The Weather during the 1987/88 Season

The 1987/88 season was the wettest in NW Syria since 1940/41, when seasonal rainfall totals exceeded those of 1987/88 by 10 to 20%. The average recurrence interval of seasons with the same rainfall as 1987/88 or more is estimated to be around 30 years. As the increased rainfall was due to increased cyclonic activity and, therefore, was of the advective type, the relative increase was more pronounced in the drier part of the region: Jinderess, our wettest site received 48% more than the long-term seasonal average of 483 mm; but Boueidar, where the long-term average is 212 mm, had 386 mm, or 81% more than 'normal'.

The season started early with heavy rains from 17 October to November 6. Then followed the only prolonged dry spell of the season which lasted, only interrupted by minor showers at some sites, until 4 December. This period was ideal for planting. December brought less than average rainfall at some sites, more than average elsewhere. January, February and March were wetter than average across the whole region. The last significant rains of the season fell around the middle of April. However the accumulated good supply of soil moisture allowed the crops to ripen with less stress than in most seasons.

The temperature throughout the season was close to the long-term average with no extremes of note. The number of frost days was below average, in particular at the drier sites, as the frequent cloud cover reduced the occurrence of radiation frosts. Altogether the weather during the 1987/88 season laid the foundation for a bumper crop, which was widely achieved.
