

Overview of project results

Final Workshop “Sustainable Land Management to Achieve Land Degradation Neutrality: Options-by-Context Approach and Tools”

24 October 2017 2017

Tunis, Tunisia

**Quang Bao Le, Richard Thomas, Enrico Bonaiuti,
Claudio Zucca, Chandra Biradar, Fajr Fradi (ICARDA)
Badabate Diwediga, Jim Jaspe, Bashar Ayyash (iMMAP)
Moayad Nadjadwi, Mahdi Hamdan (CodeObia)**

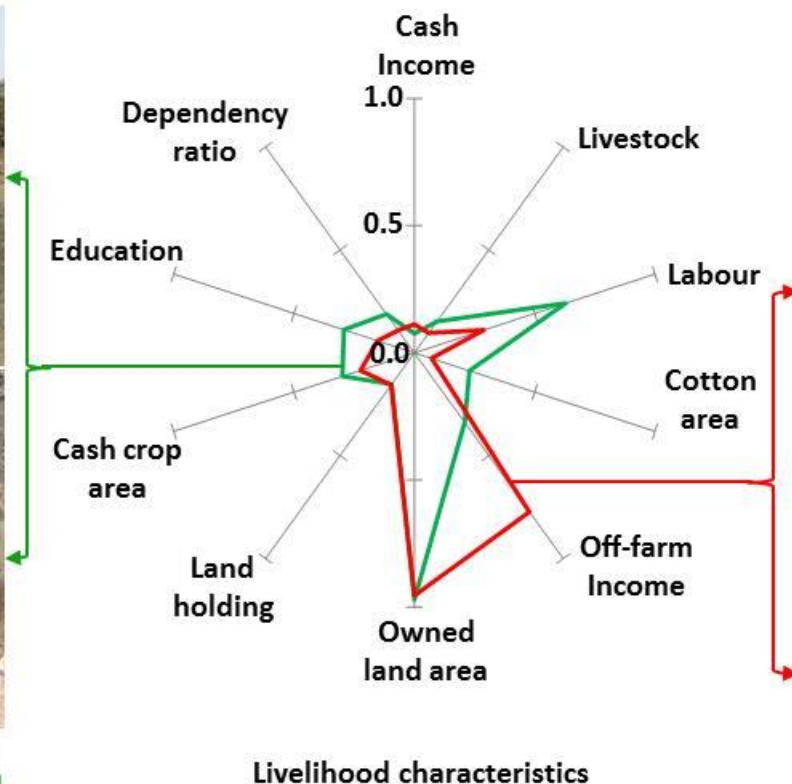

RESEARCH
PROGRAM ON
Dryland Systems

- Sustainable Land Management (SLM) options are fitted to the social, economic and ecological contexts.
 - Example: Reuse crop-livestock residues by compost in Southwestern Burkina Faso

Nutrient management practices by a farm-based, labour-endowed and educated household

Nutrient management practices by an off-farm oriented household

Problems

- High contextual diversity of drylands vs. “uniform blanket” approach in promoting SLM over large scales
- Lack of tools supporting comparative analyses/assessments of SLM options by context, thereby informing upscaling efforts

Aim

To provide land users, projects/programmes and policy decision-makers with a web-based tool as being:

- plausible, robust extrapolation domains for guiding decisions on the selection and use of SLM options,
- an open platform for docking different disciplinary projects into integrative/holistic and converging actions for promoting SLM at scale.

GeOC's Development Stages

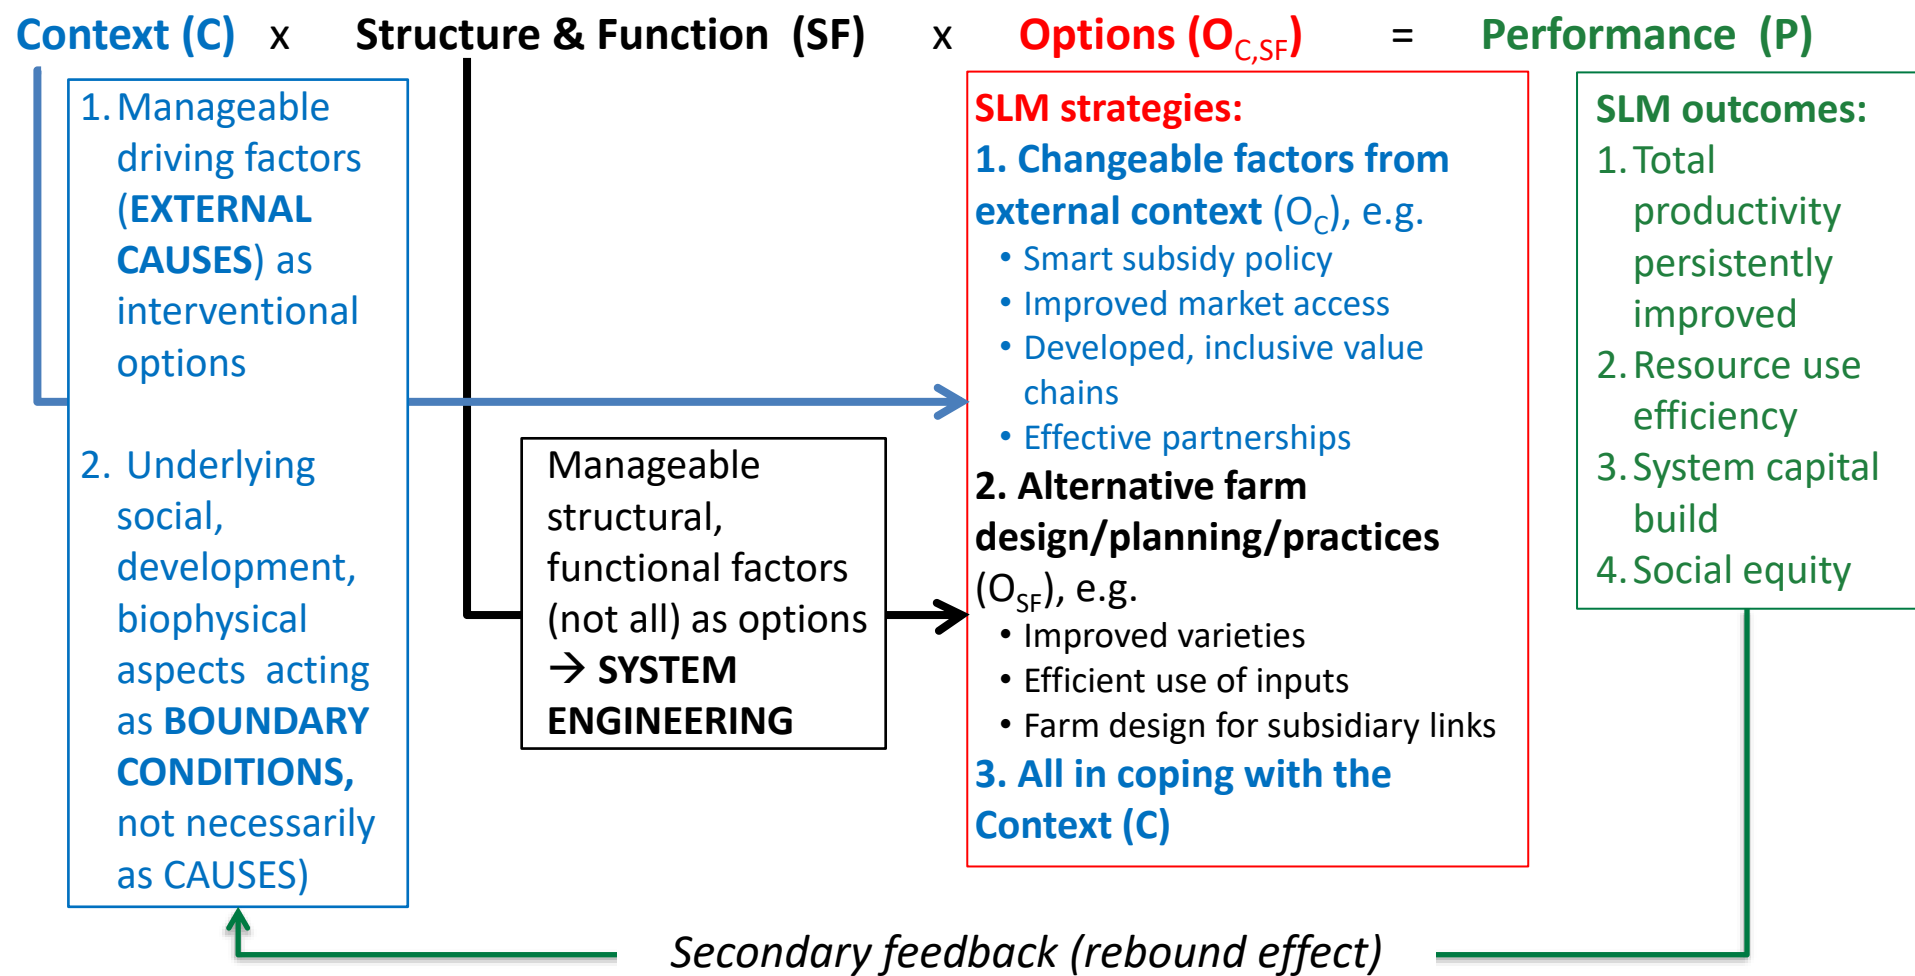

Geo-informatic Options-by-Context (GeOC) - A framework AND tools for defining, monitoring, assessing and co-learning SLM options fitted to the social-ecological contexts

2016: Funded by CRP Dryland Systems (CRP 1.1)

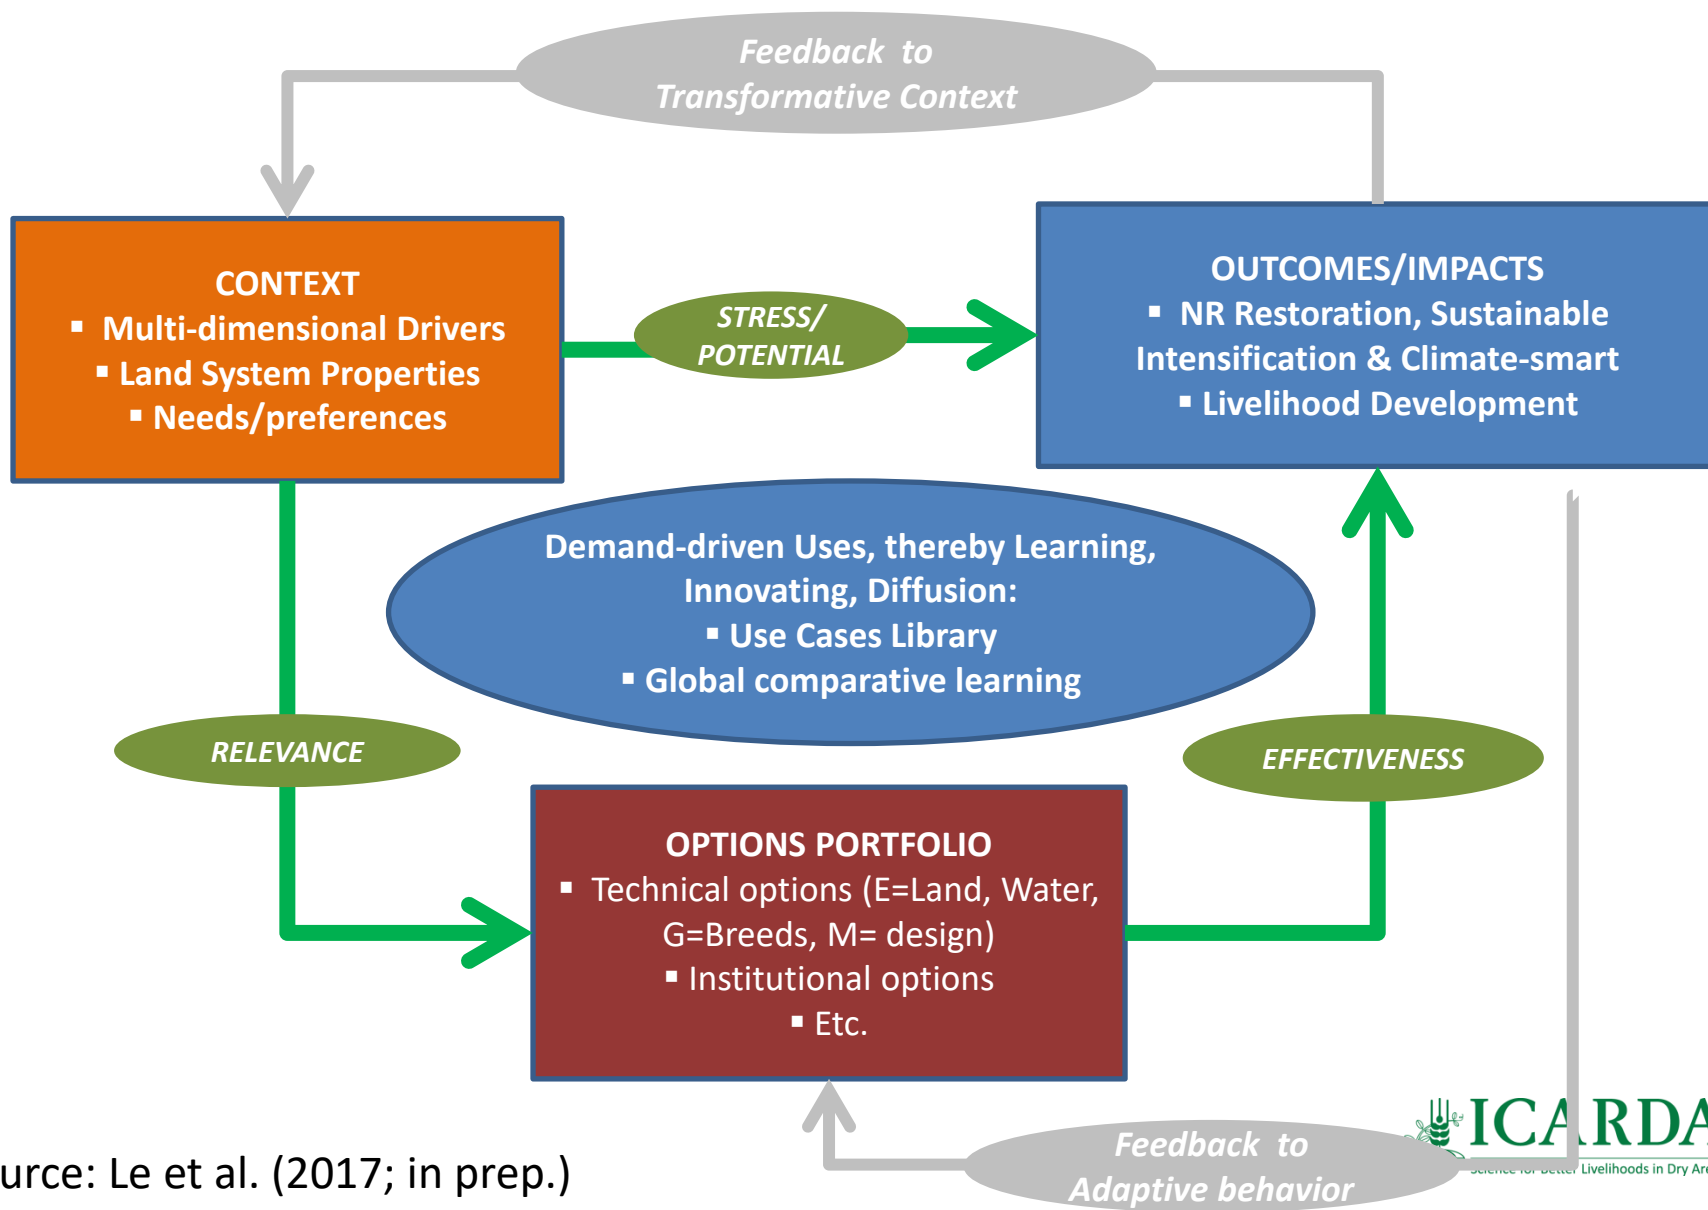

- Conceptualization of GeOC approach, framework, functions and components
- Design of GeOC tools: Off-line SLM form (Excel), WebGIS and online SLM form (initiated)

2017: Funded by GIZ/BMZ small grant (this project)

- Building the first version of WebGIS and online SLM form, all inter-linked
- Database of SLM options-by-context in two selected governorates in Tunisia (Zaghouan & Medenine) for GeOC
- GIS database for GeOC
- Case studies in Tunisia

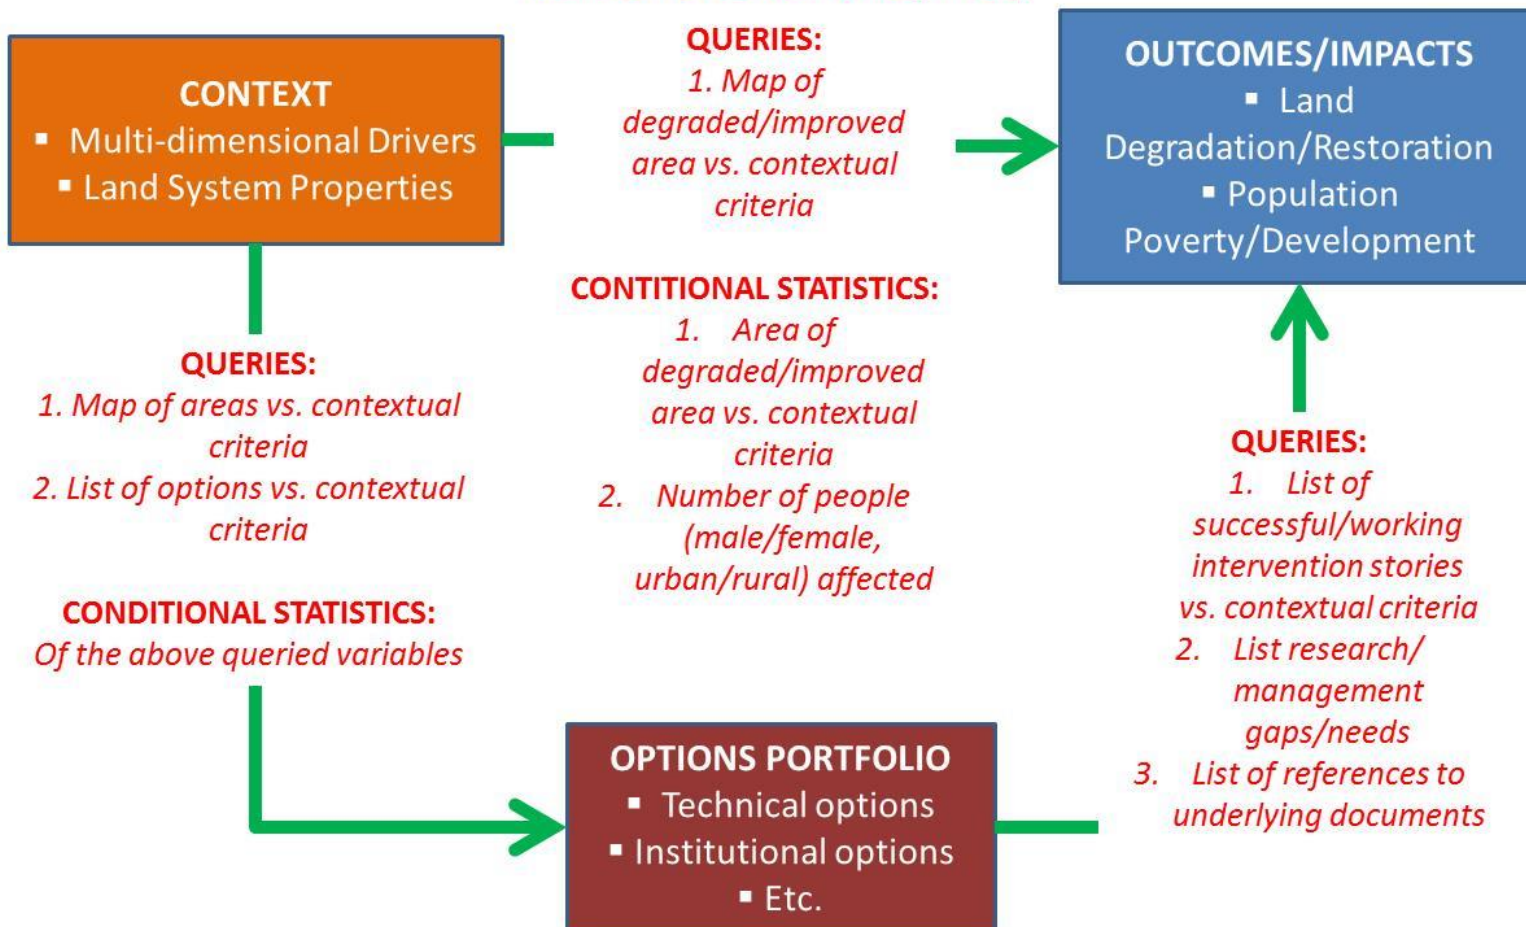

GeOC's Conceptual Framework

GeOC's Key Functions

KEY USING FUNCTIONS (in red)

Web-based GIS*

- Web-based GIS for key functions (filtering/querying, zonal statistics, spatial similarity analysis)
- Global GIS database of divers and performance/impact indicators of SLM

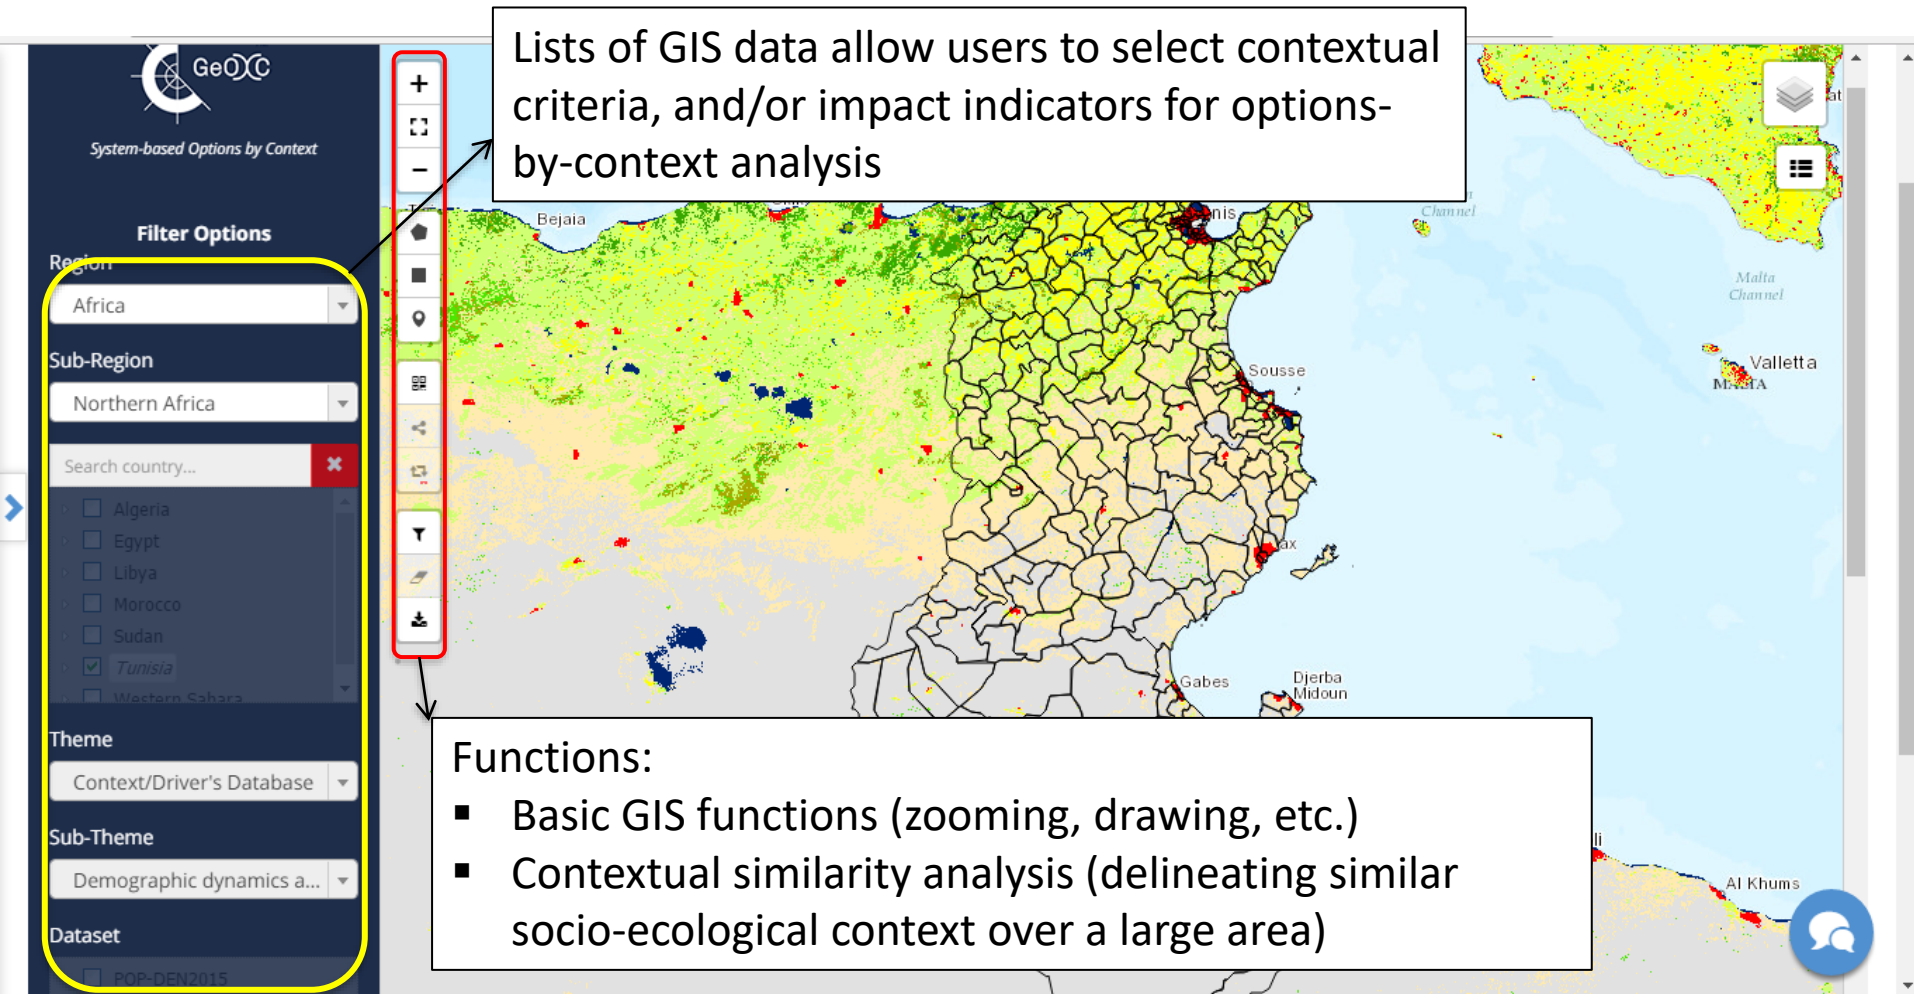

Matched
Synchronized

Sustainable Land Management (SLM)

- Web-based form* for importing standardized and completed SLM options by context
- Database of SLM options by Context

Note: red asteric * refers to complementaty aspects compared to WOCAT

Graphic interface of GeOC's WebGIS and key functions

The screenshot displays the GeOC WebGIS interface. On the left, there is a 'Filter Options' sidebar with dropdown menus for 'Region' (Africa), 'Sub-Region' (Northern Africa), and 'Theme' (Context/Driver's Database). A search bar for 'Search country...' is also present, with a list of countries including Tunisia (checked). Below the filters is a 'Dataset' section with 'POP-DEN2015' selected. The main area shows a map of Tunisia with a color-coded overlay representing socio-ecological context. A vertical toolbar on the left side of the map contains icons for zooming, panning, and other GIS functions. A red box highlights this toolbar, with arrows pointing to two text boxes. The top text box states: 'Lists of GIS data allow users to select contextual criteria, and/or impact indicators for options-by-context analysis'. The bottom text box, titled 'Functions:', lists: 'Basic GIS functions (zooming, drawing, etc.)' and 'Contextual similarity analysis (delineating similar socio-ecological context over a large area)'. The map includes labels for cities like Bejaia, Tunis, Sousse, and Gabes, and geographical features like the Malta Channel and Valletta.

Lists of GIS data allow users to select contextual criteria, and/or impact indicators for options-by-context analysis

Functions:

- Basic GIS functions (zooming, drawing, etc.)
- Contextual similarity analysis (delineating similar socio-ecological context over a large area)

Off-line SLM form

Template for Standardized Description of Sustainable Land Management (SLM) Technologies with a Focus on Field-Landscape Level			
1	Created by Quang Bao Le, Program Management Unit (PMU), CGIAR Research Program on Dryland System; Claudio Zucca, ICARDA		
2	Note: This CRP-DS template of SLM technology description is partly adapted from those of WOCAT, however with major modifications and additions. Though CRP-DS is still development this template until August 2016, it can be used for cataloguing SLM technologies considered by current CRP-DS projects.		
3	<u>Field of information</u>	<u>Your input</u> Note: please field the lined boxes, with the use of the provided formats or information lists if you are asked in the Note column.	<u>Note</u>
4			
5			
6	PART 1: GENERAL INFORMATION		
7			
8	1.1. Name of the SLM Technology		
9	1.1 Name:	Jessours rainwater harvesting in southern Tunisia	Max 70 letters including
10	1.2 Locally used name:	"Jessours"	Max 70 letters including
11	1.3 Country:	Tunisia	Select from the provided
12		Tunisia	
13	1.2 Documentors and Resouces Persons/Information		
14	Main Documentor		
15	Name (first name + last name):	Uganda	
16	Sex (M/F):	Ukraine	
		United Arab Emirates	
	2.3.1 Illustrative photo 1:		Insert a photo
	Caption of photo 1	Technical sheme for jessour (ref: Taamalah et al., 2010, "Gestion durable de terres en Tunisie, Bonnes pratiques agricoles", p:7)	
	2.3.2 Illustrative photo 2:		Insert a photo

Web-based SLM interfaces

You must fill in the information with **RED ASTERISK ***

3.1 Purposes of the SLM technology

3.1.1 Most important purpose *

Reduce land degradation (soil, water, vegetation)

3.2 Type of the SLM technology

3.2.1 Most relevant SLM type *

S1: Terraces

S2: Bunds, banks

S3: Graded ditches, channels waterways

S4: Level ditches, pits

3.3 SLM measures comprising the SLM technology

3.3.1 Type of agronomic measures

2

Description of the SLM Technology

3

Purpose and Classification Of SLM Technology

4

Geographic Location and Socio-Ecol context/Enviro

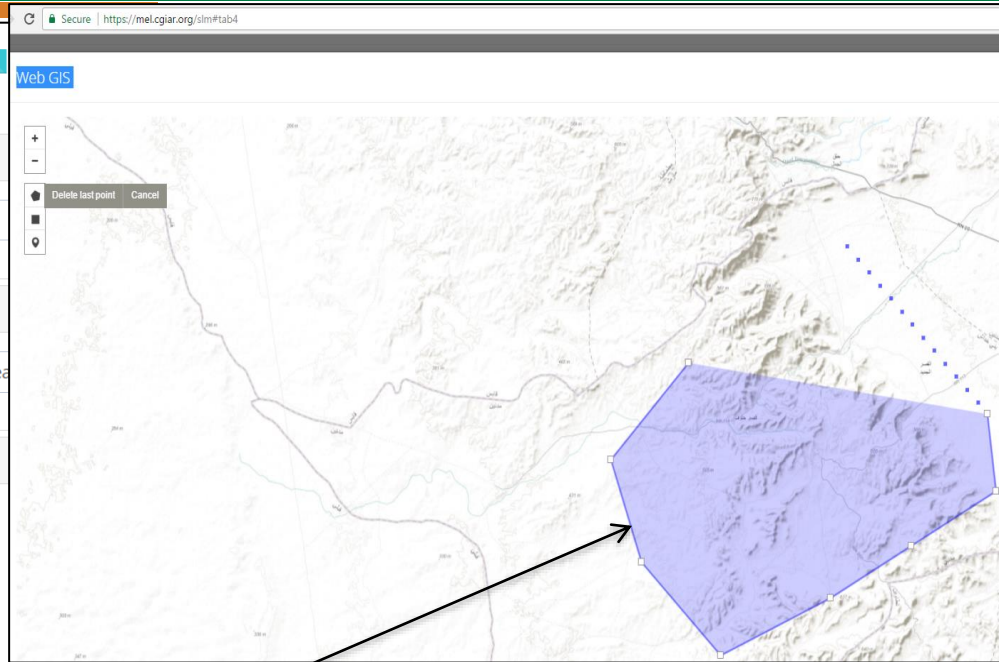

Information with **RED ASTERISK ***

Details in a later presentation – Fadi et al.

Main features

- Data entry forms both off-line Excel and web-based form* for standardized description of SLM (adapted from with from WOCAT)
- Multi-variate* database rather than static factsheet
- Synchronized with the GIS database and tool (WebGIS) to retrieve - hence relate with - contextual and impact variables at larger scale*
- Peer-reviewed process for submitted SLM (handled as paper submission to journals)

Added values

- Relatively match with WOCAT questionnaire; allow either on- or off-line inputs
- Allow user-defined queries in response to SLM's attributes selected (e.g. type, environmental and socio-economic characteristics)
- Allow spatially explicit analysis/assessment
- Better quality management

Note: red asterisk * refers to complementary aspects compared to WOCAT

GeOC links for GeOC tools:

- WebGIS: <https://mel.cgiar.org/visualization> (users'/testers' registration needed)
- SLM form/data: <https://mel.cgiar.org/slm> (users'/testers' registration needed)
- Approval: <http://mel.cgiar.org/approval> (only for tool admin)

Five tutorial video clips:

- Introduction of GeOC tool - motivation, goals, potential users ([video clip 1](#))
- Introduction of the WebGIS tool- key functions ([tutorial video clip 2](#))
- Use case 1: Context-based analysis: searching implemented SLM options with a defined context ([tutorial video clip 3](#))
- Use case 2: Option-based analysis: searching similar context(s) given a considered SLM option ([tutorial video clip 4](#))
- General introduction of the web-based SLM input form ([tutorial video clip 5](#))

Available on You Tube:

<https://www.youtube.com/watch?v=NLpd9vY21CA&list=PLRIsJ0x4IVjn1NUkaWPcIVswWv5jKtEVH>

- Compiles common intermediate and underlying drivers/causes of land use/management practices:
Biophysical, demographic, economic, resource governance/institutional factors (26 GIS layers: 10 newly calculated; 16 extracted/downscaled from global datasets)
- Includes key indicators for performances and impacts of land management practices:
Trend of biomass productivity, rain use efficiency, land productivity gap, affected/benefited population (7 GIS layers: 5 newly calculated, 2 extracted/downscaled from global datasets)
- These data are:
 - Embedded in the WebGIS tool for performing its functions
 - Available as individual GIS data for SLM-related studies (e.g. soil erosion assessment, SLM adoption analysis, SLM's impact assessment)

[Details in a later presentation – Le et al.](#)

SLM Options-by-Context (SLM OxC) database:

Zaghouan		Medenine		Total database	
SLM types	SLM OxC	SLM types	SLM OxC	SLM types	SLM OxC
11	22	18	29	29	51

Each SLM OxC includes:

- Characteristics of SLM technology, socio-economic and biophysical context/environment (Excel sheet and on-line form)
- Connected GIS vector/shape file of the SLM implementing sites (detailed polygons rather than a point as in WOCAT)

[Details in later presentations – Diwediga et al.; Hermassi et al.; Ouessar et al.](#)

Case study

- GIS-based assessment of SLM options on net primary productivity (NPP) and rain use efficiency across geographic contexts
- Visualizing areas of contextual similarities to support SLM out-scaling

[Details in a later presentation – Le et al.](#)

- Multi-temporal and multi-scale assessment of landscape pattern dynamics in Tunisia

[Details in a later presentation – Le et al.](#)

Some remarks and/or lessons learned

- Objectives expected seems higher than the funding and timing availabilities of project (compared to other projects of similar type)
 - It would have been easier for the team if there were more fund and time.
 - What has been produced means a over-expected efforts made by the project team, with a lots of in-kind contributions from ICARDA team and partners
- The effective teaming of SLM scientists and software developers demands consideration time and fund
