

5213 deliverable report RTB 2016 to be rescheduled for 28.2.2017: OFSP population PGH15 field trials completed and PJ & PZ parents selected for intra genepool recombination

Output SW2.6.3.1: Global OFSP breeding population for wide adaptation & earliness [2019] Output lead: Wolfgang Grüneberg

Authors: Grüneberg WJ, E Eyzaguirre, and F Diaz

Data for PGH15 from harvests in the environments Satipo 2015, Satipo 2016, and Ica 2016 are available (in total 2222 plots). In February 2017 we will select among parents of this PGH15 population to conduct intra-genepool crosses for the next reciprocal recurrent selection cycle in Peru and to repeat all out-standing crosses on large scale for true seed shipments to Asia. Deliverable needs to be rescheduled to end of February 2017. Reason for the delay is the current workload of staff with the planting of experimental populations and selection of parents requires proper statistical analysis and joint selection decision of the staff members Diaz, Eyzaguirre, and Grüneberg.
