Design soil-water-ecosystem processes experiments and monitoring campaign

November 17, 2021

TIME	TOPIC	TRAINER
09:00 – 09:15	Welcome and Introduction	Stefan Strohmeier & Mira Haddad
09:15 – 09:30	General discussion of the ecosystem services concept	Stefan & Mira (& group)
09:30 – 10:45	Assessment of selected ecosystem services using tools/models	Mira
10:45 – 11:00	Discussion; Q&A	Stefan & Mira (& group)
11:00 – 11:15	<i>Coffee break</i>	
11:15 – 12:15	Advanced ecosystem services assessment case studies	Stefan
12:15 – 13:00	<i>Lunch break</i>	
13:00 – 13:45	Robust soil-water-ecosystem processes experiments and monitoring methods in drylands	Stefan
13:45 – 14:00	<i>Coffee break</i>	
14:00 – 15:00	Designing soil-water-ecosystem processes experiments and monitoring campaign	Group work

“An ecosystem is a geographic area where plants, animals, and other organisms, as well as weather and landscape, work together to form a bubble of life. Ecosystems contain biotic or living, parts, as well as abiotic factors, or nonliving parts”

National Geographic Society | <https://www.nationalgeographic.org/encyclopedia/ecosystem/print/>

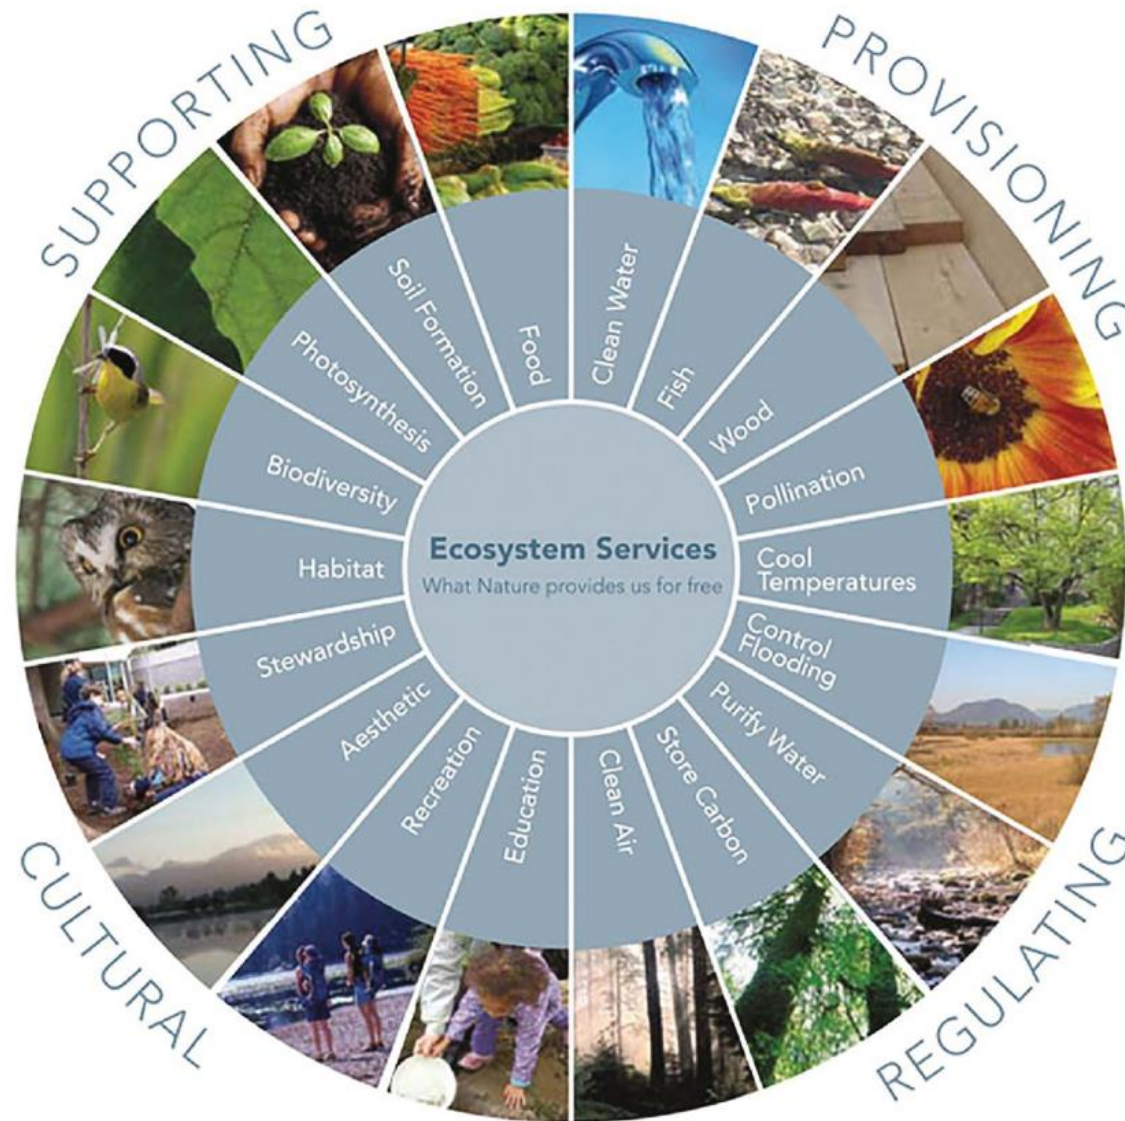

- > An ecosystem consists of biotic and abiotic components and thrives their interaction
- > Ecosystem services are the benefits from functioning ecosystems to humans

Development and history

- Scientific discussion on ecosystem (services) exists since decades
- 1990s: Various UN agencies identified the need for a harmonized procedure for ecosystem (services) assessment
- 2000s: Launching of the Millennium Ecosystem Assessment (MA)

MA confined 4 categories of ecosystem services

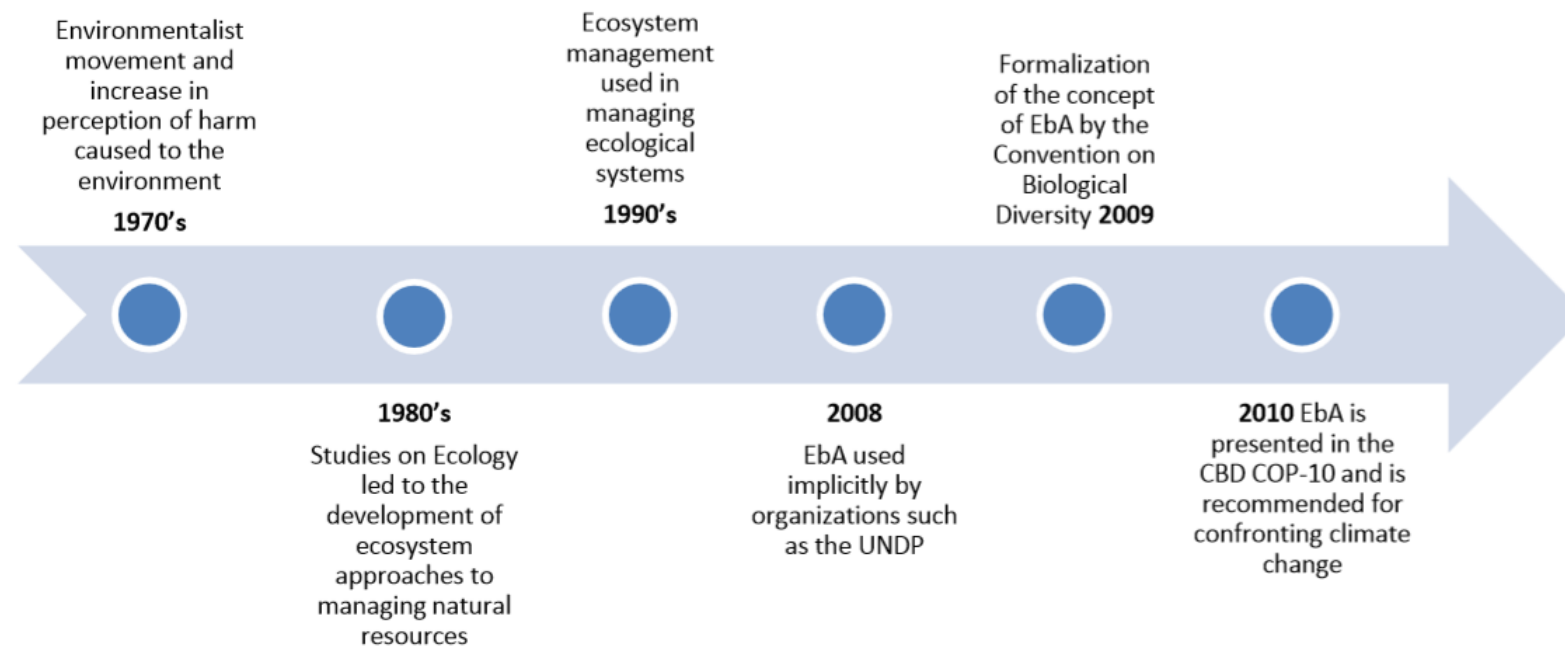

- Supporting
- Provisioning
- Regulating
- Cultural

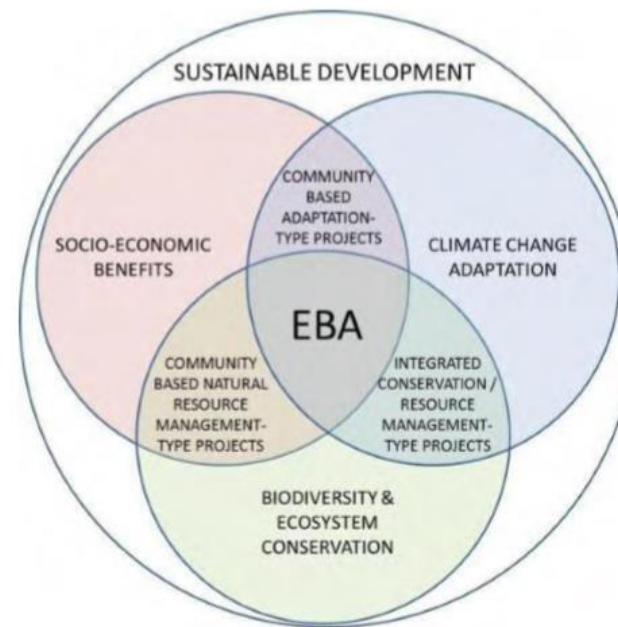

Climate Change is one of the greatest challenges of our time...

“Ecosystem-based adaptation is the use of biodiversity and ecosystem services as part of an overall adaptation strategy to help people to adapt to the adverse effects of climate change.”

CBD, 2009

EbA initiatives draw on a wide range of existing **practices** employed by the conservation and development sectors, such as **sustainable natural resource management**, **community-based natural resource management** and **community-based adaptation**.

Livelihood sustenance and food security

help to ensure continued availability and access to essential natural resources so that communities can better cope with current climate variability and future climate change

Sustainable water management

Managing, restoring and protecting ecosystems can also contribute to sustainable water management by improving water quality, increasing groundwater recharge and reducing surface water run-off during storms.

Carbon sequestration

Sustainable management of forests can store and sequester carbon by improving overall forest health, and at the same time sustain functioning ecosystems that provide food, fibre and water resources that people depend on.

Hassan et al, 2005

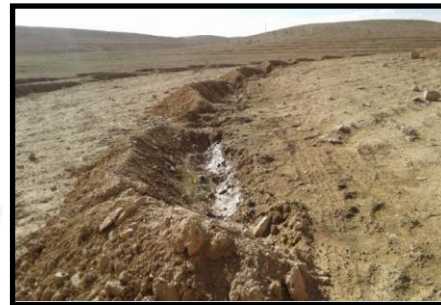

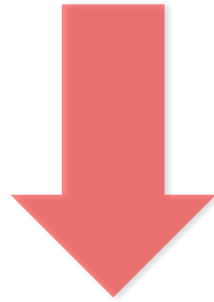

... can help to assess the dynamics and value of and within the 'existing' system...

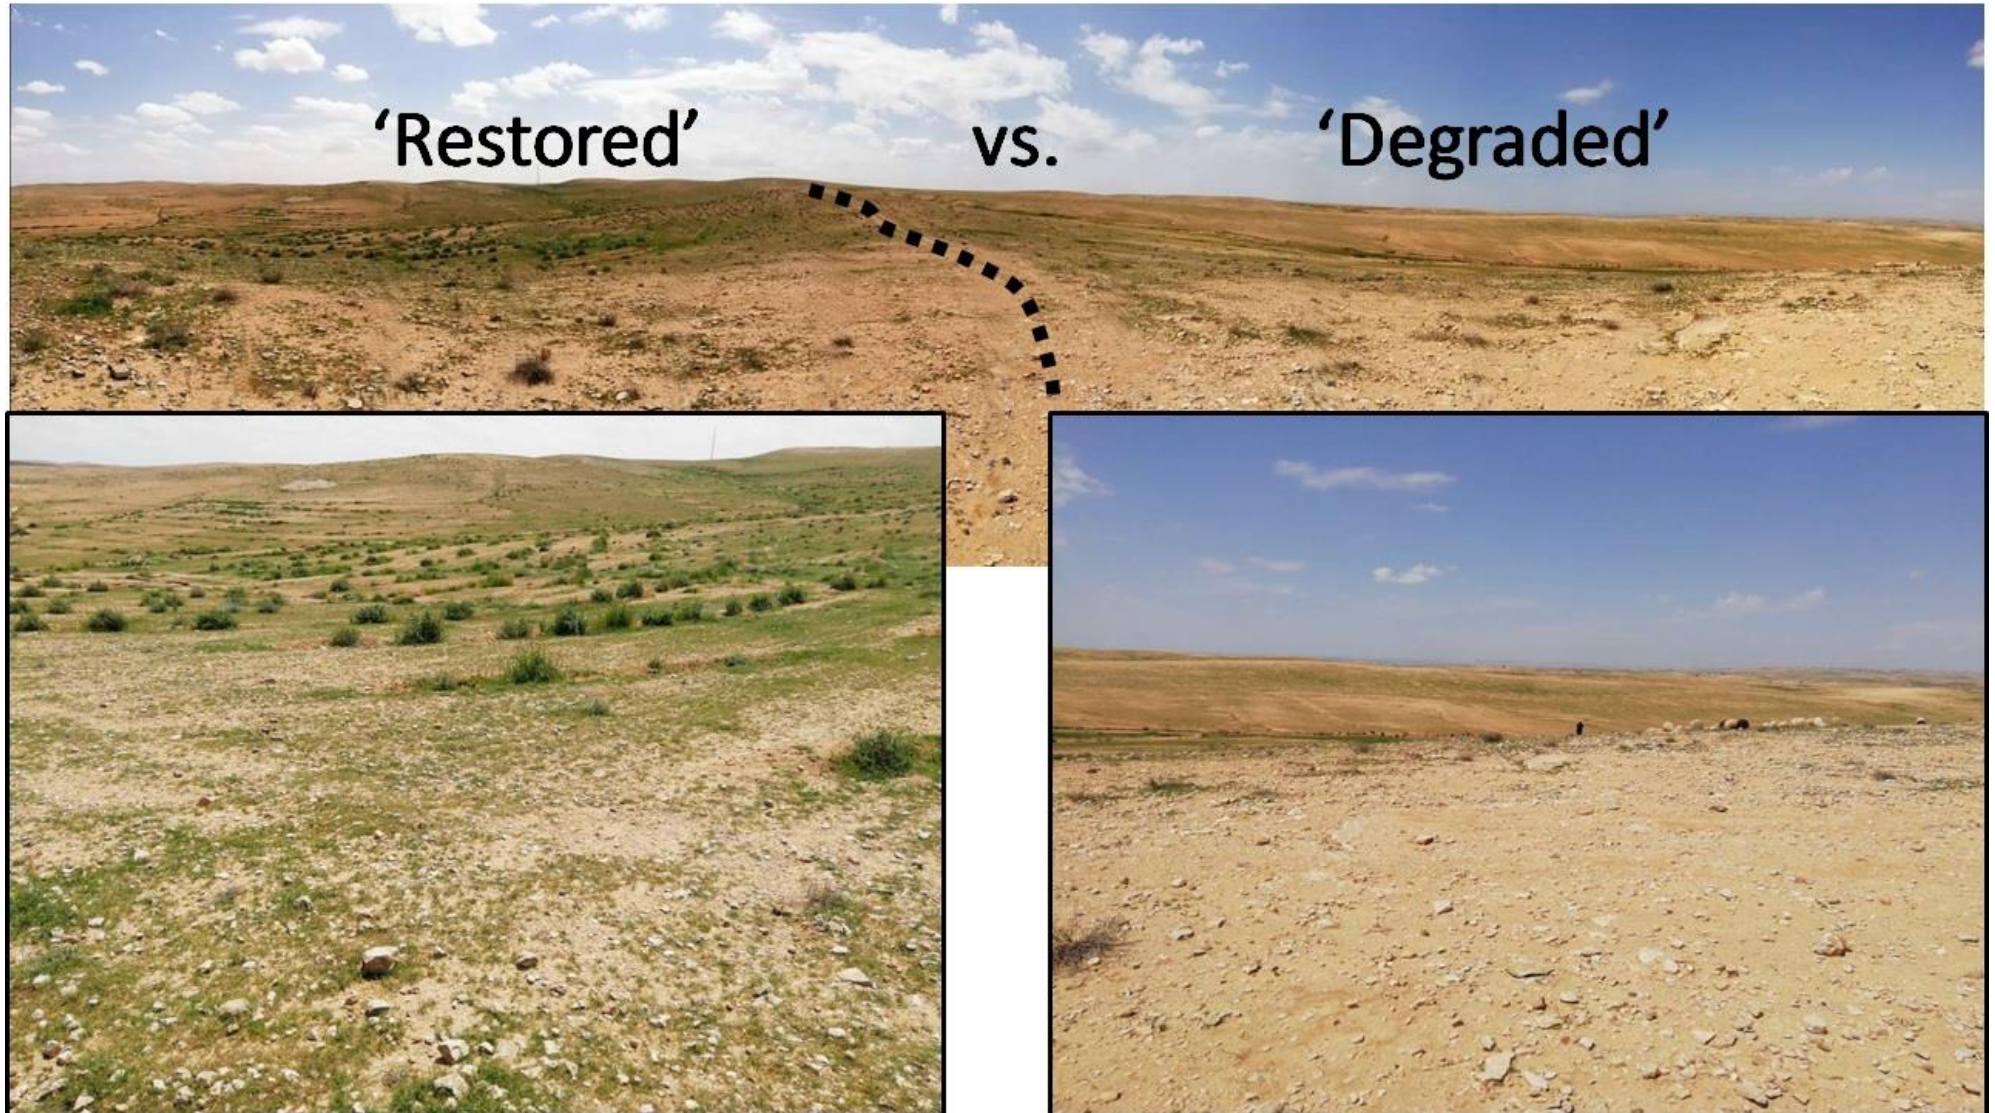

... can generate scenarios of potential futures for pre-evaluation...

Modeling: rangeland status transition scenarios

Modeling: rangeland status transition scenarios

The screenshot shows the RHEM Web Tool interface in a web browser. The URL is <https://apps.tucson.ars.ag.gov/rhem/>. The page features a navigation bar with links for Home, About, Documentation, and Contact Us. A status bar indicates the current date as Monday, April 19, 2021, and the version as RHEM v2.3 Update 5. The main content area is titled "The RHEM Web Tool" and describes the tool's purpose: to provide a web-based interface for the Rangeland Hydrology and Erosion Model (RHEM). It lists the goals of the web application, which include simplifying the use of RHEM, managing user sessions, centralizing scenario results, comparing scenario results, and providing tabular and graphical reports. A prominent orange button labeled "RUN RHEM" is visible on the right side of the page.

Now: Mon, Apr 19 2021 Current Version: RHEM v2.3 Update 5

The RHEM Web Tool

The RHEM Web Tool is a web-based interface for the Rangeland Hydrology and Erosion Model (RHEM). The interface allows users to input commonly known rangeland characteristics and use parameter estimation equations to construct model input files and run the RHEM model.

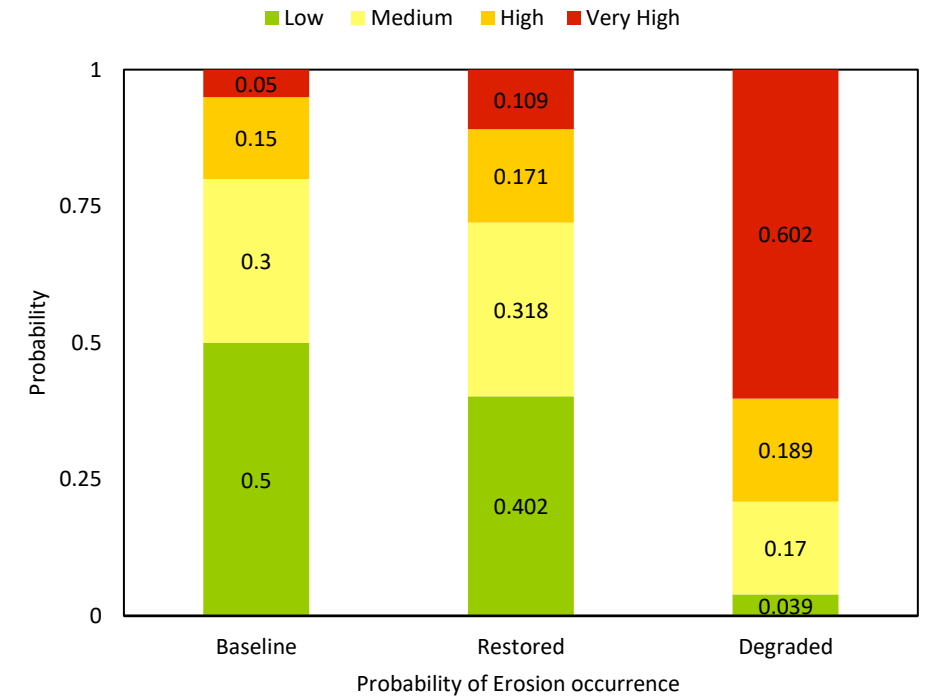

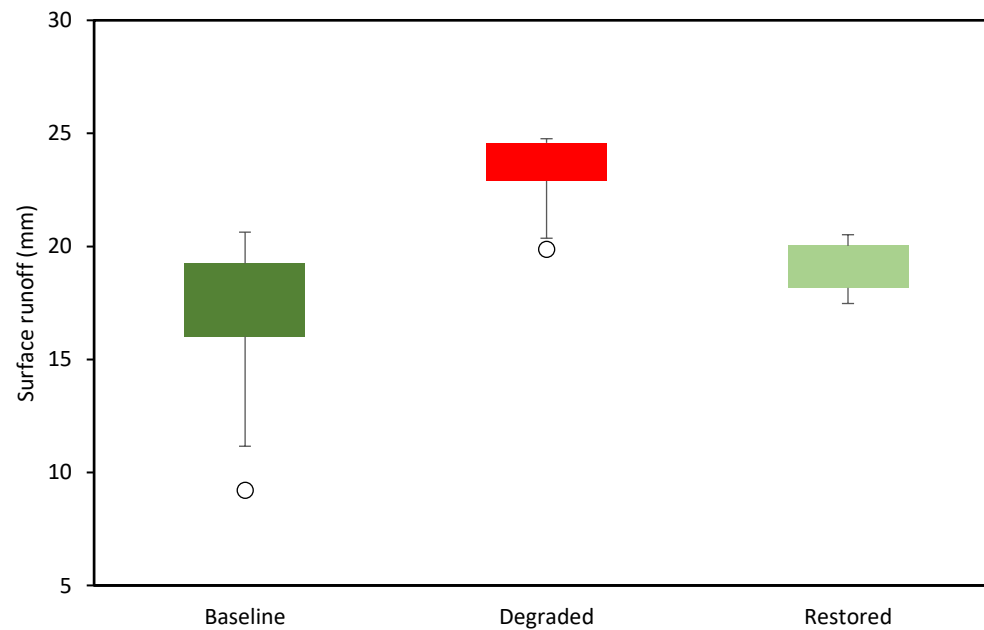

This web application was built with the following goals in mind:

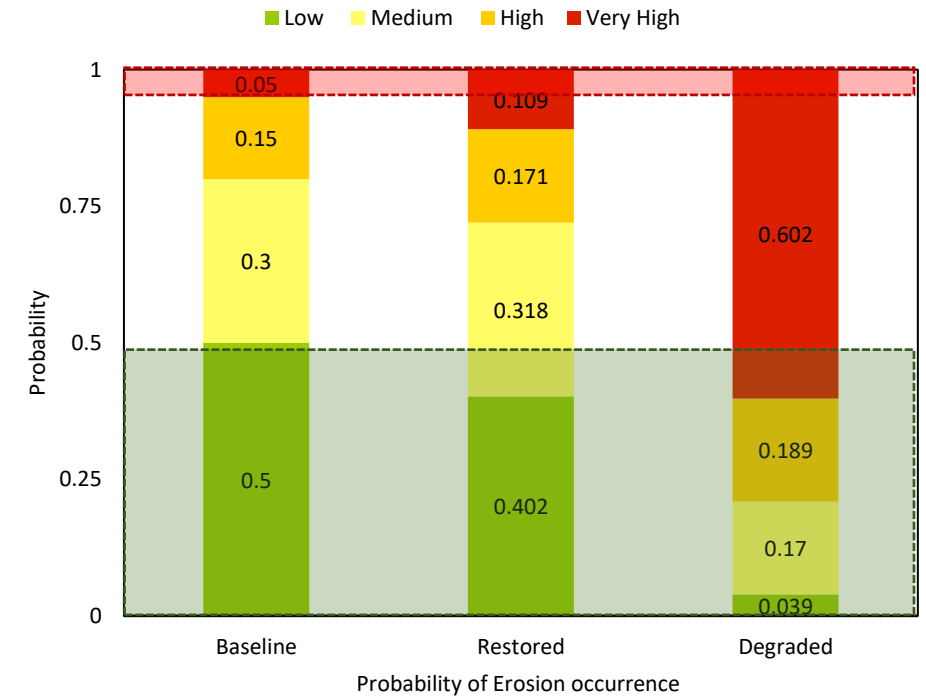

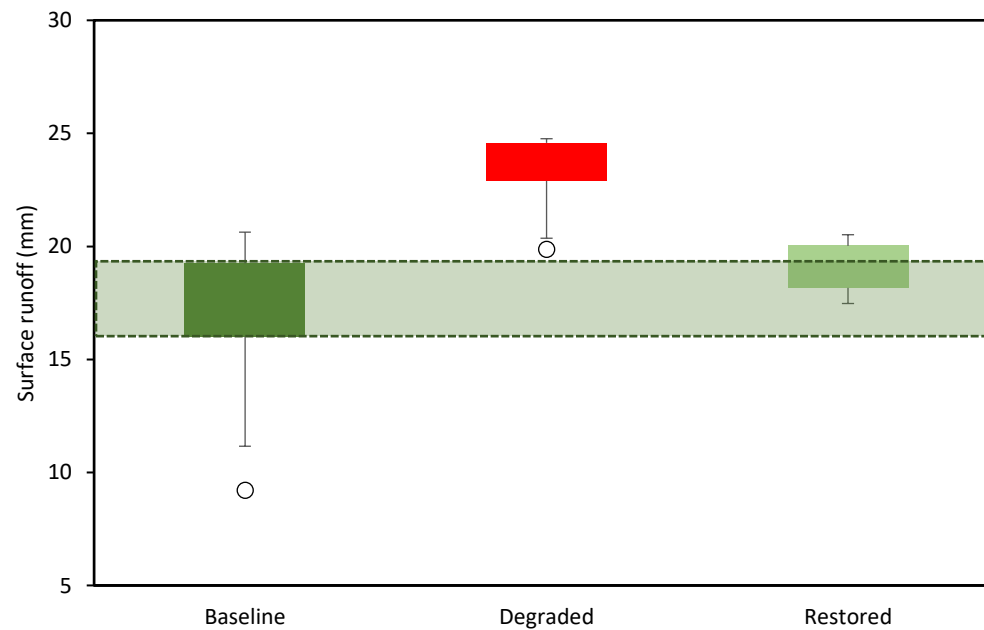

- Simplify the use of RHEM
- Manage user sessions
- Centralize scenario results (model runs)
- Compare scenario results
- Provide tabular and graphical reports

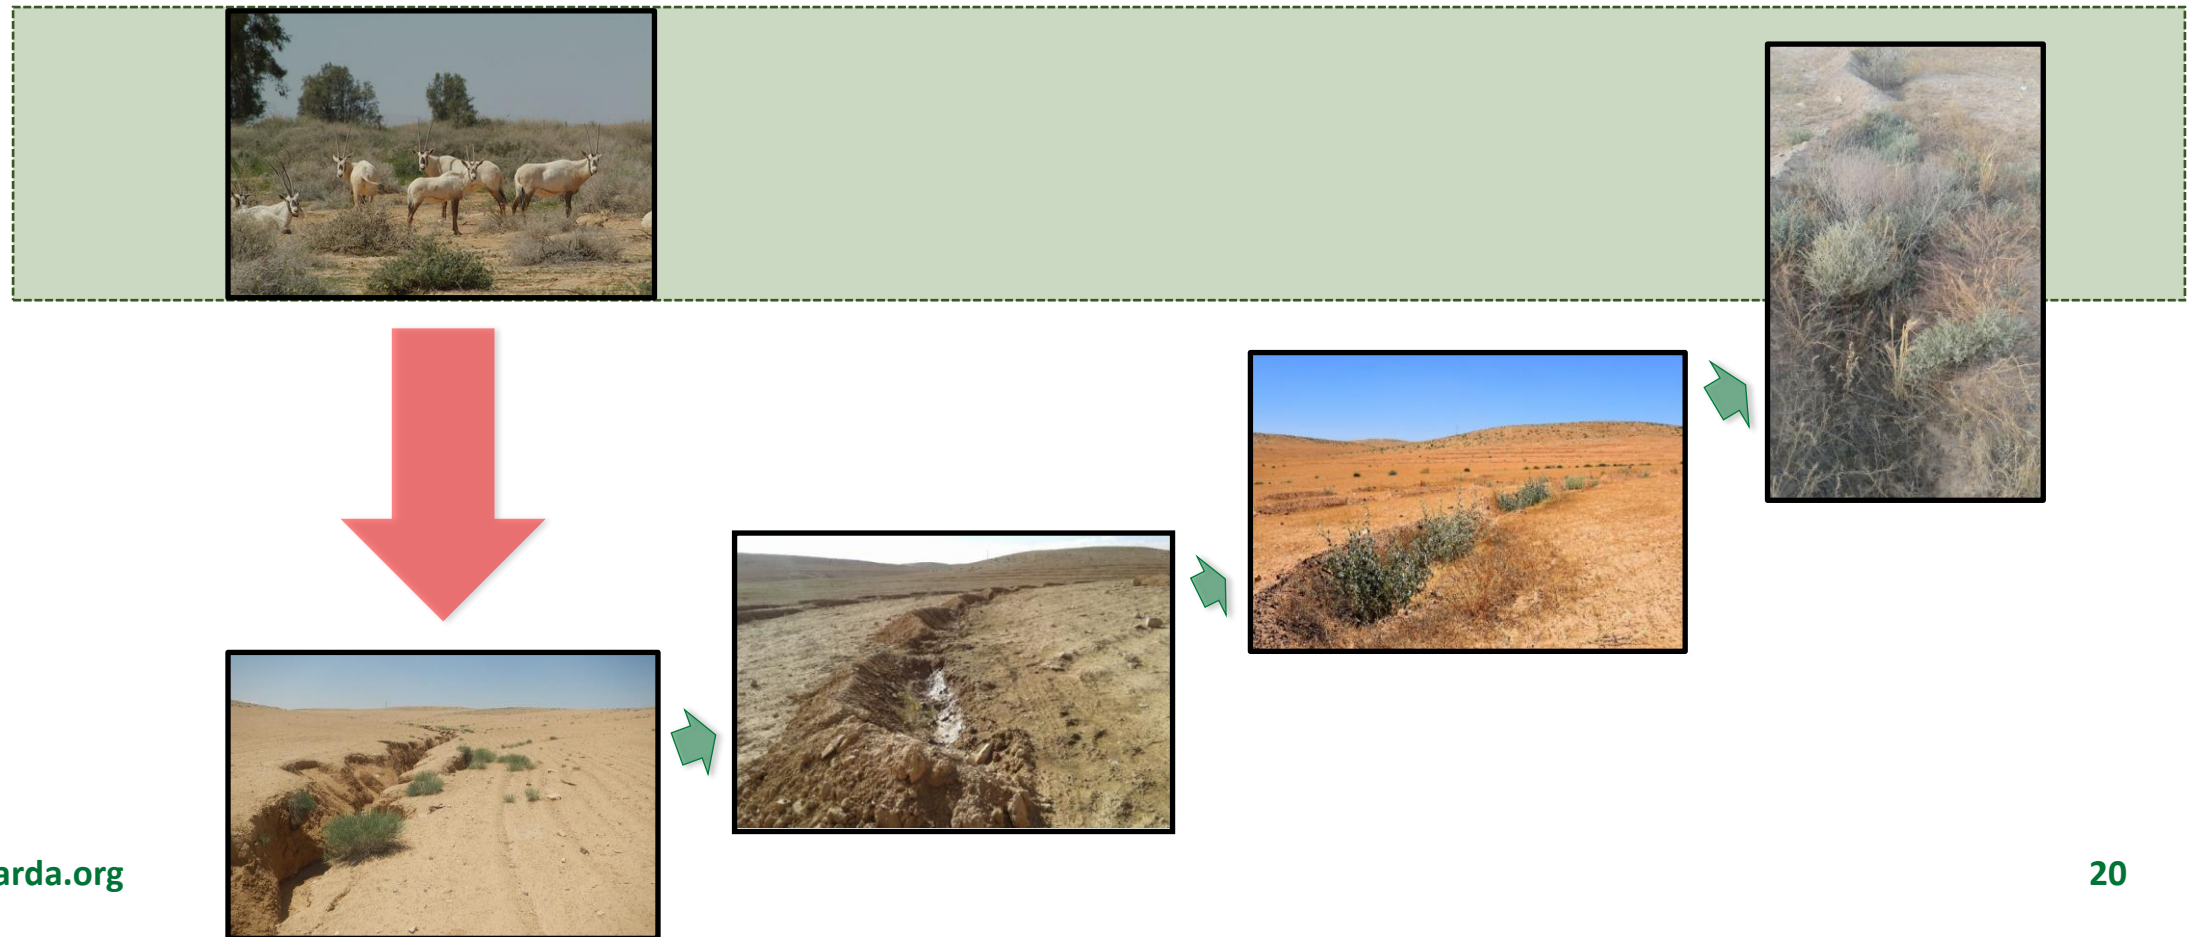

RUN RHEM

Built with:

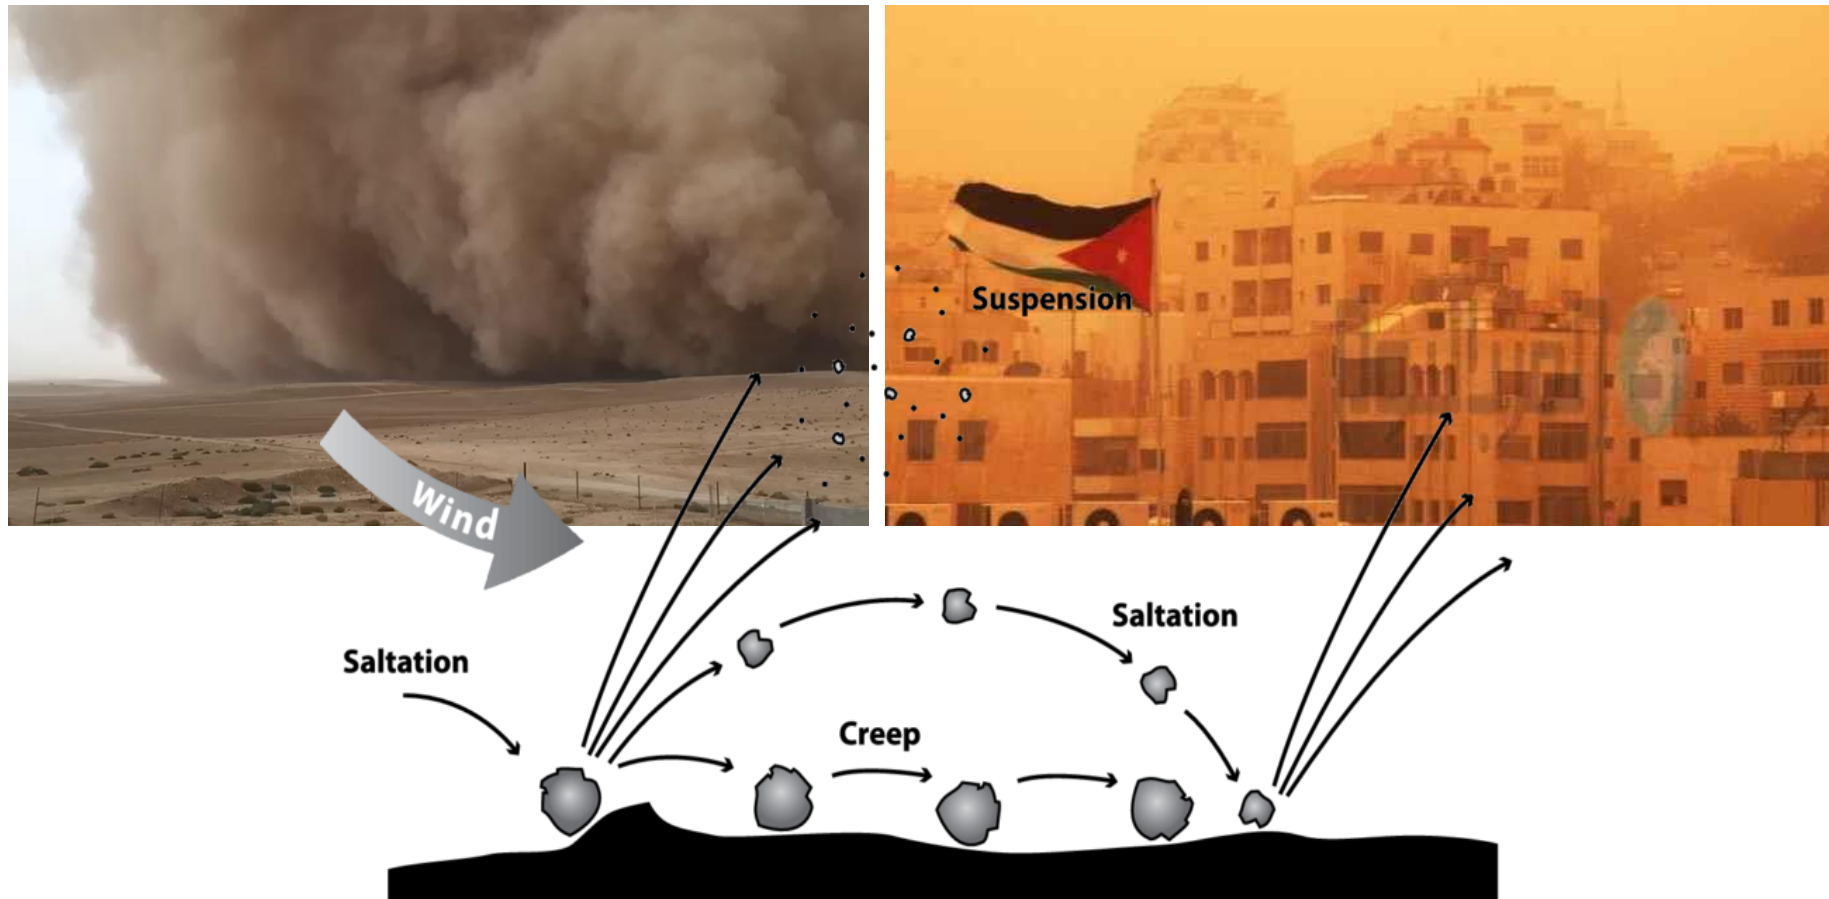

1. RHEM
2. Cligen Weather Generator (v5.3)
3. CodeIgniter
4. MySQL
5. Google Maps

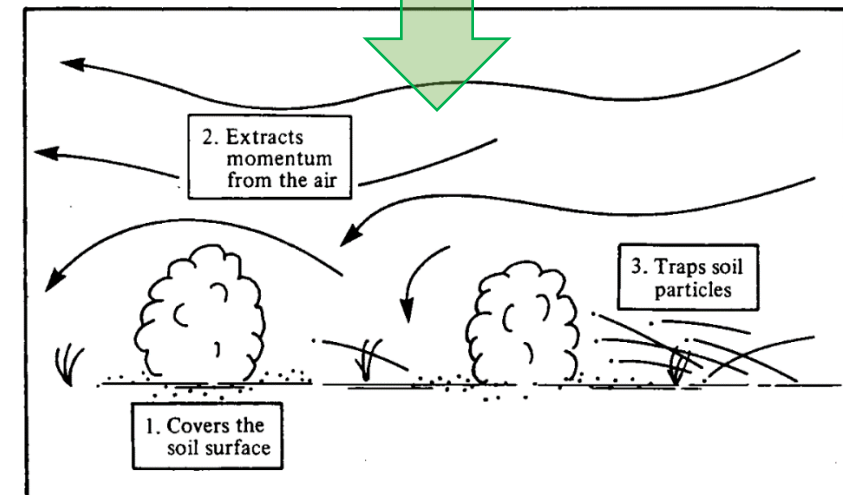

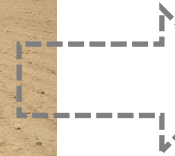

Ecosystem services: combatting Sand and Dust Storms

Agro-pastoral rehabilitation using in-situ Water Harvesting

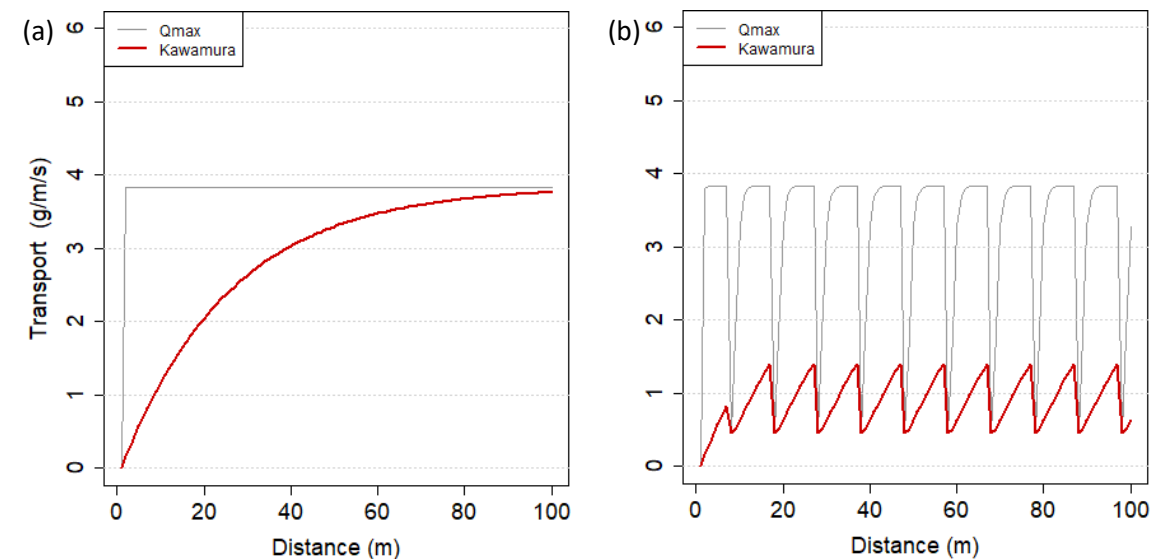

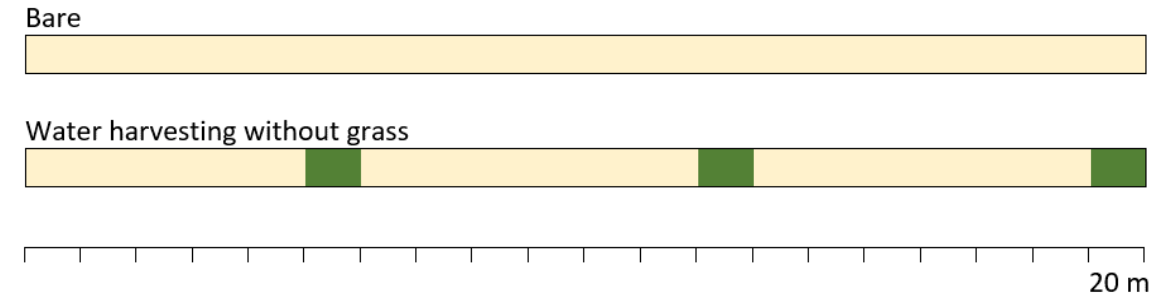

Setting up a wind erosion model

- 1D Cellular model (CCAS)
- Horizontal transport -> vertical flux
- WH and vegetation as obstacles (roughness)

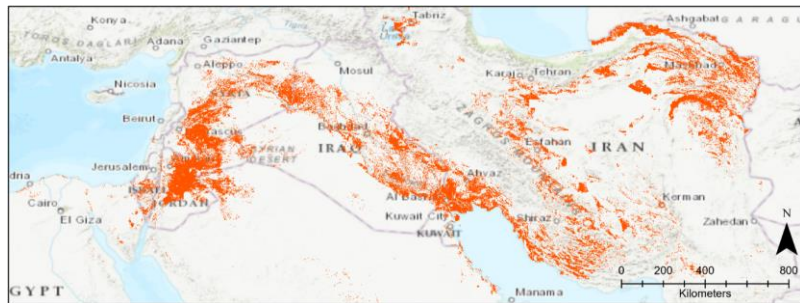

Acknowledgement: Joint MSc of Utrecht University, National and Kapodistrian University of Athens, and ICARDA.

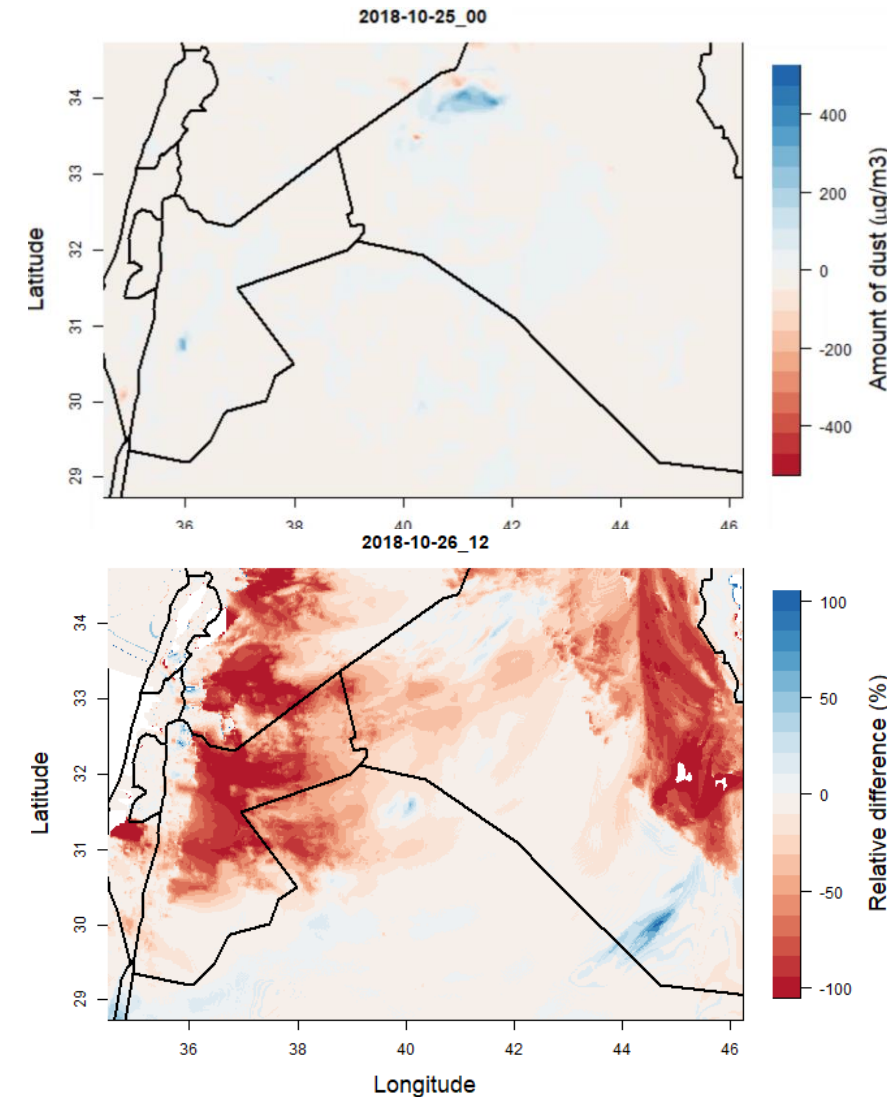

Large scale ecosystem benefits: combating sand and dust storms

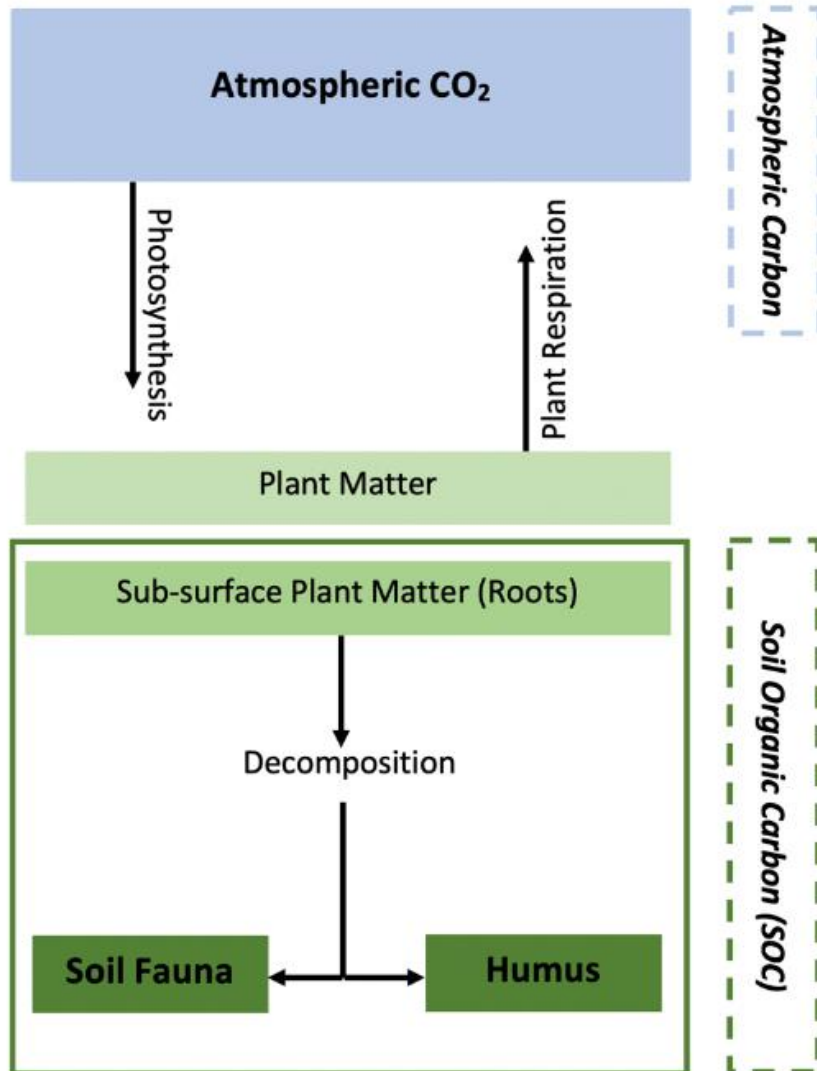

Outscaling mechanized micro WH

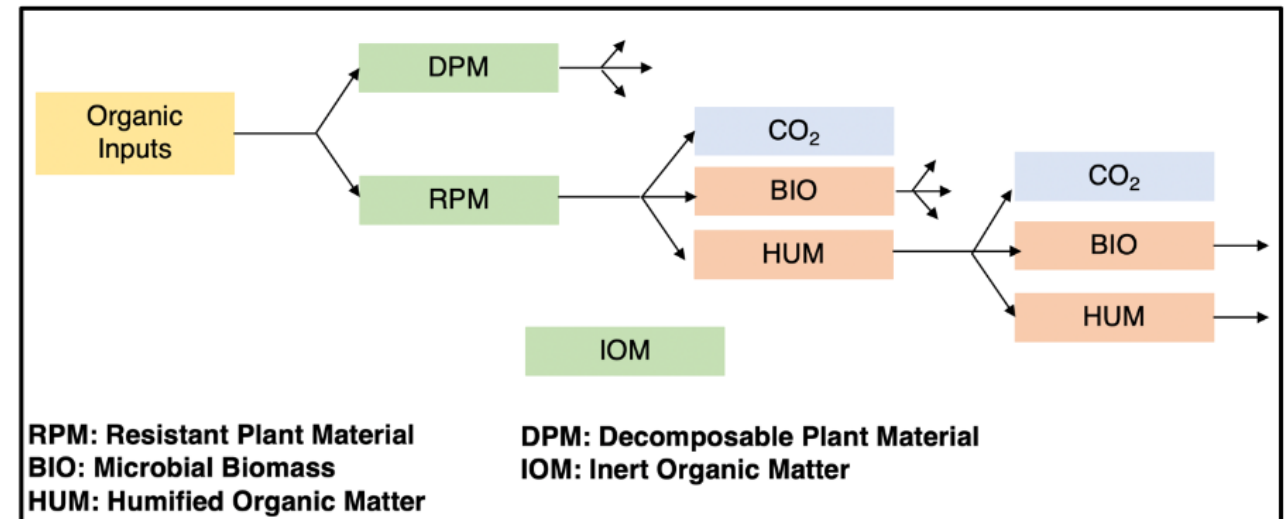

- GIS based site suitability (preliminary assessment)
- Climate, topography, soil, land cover/use
- Large atmospheric array simulation using RAMS

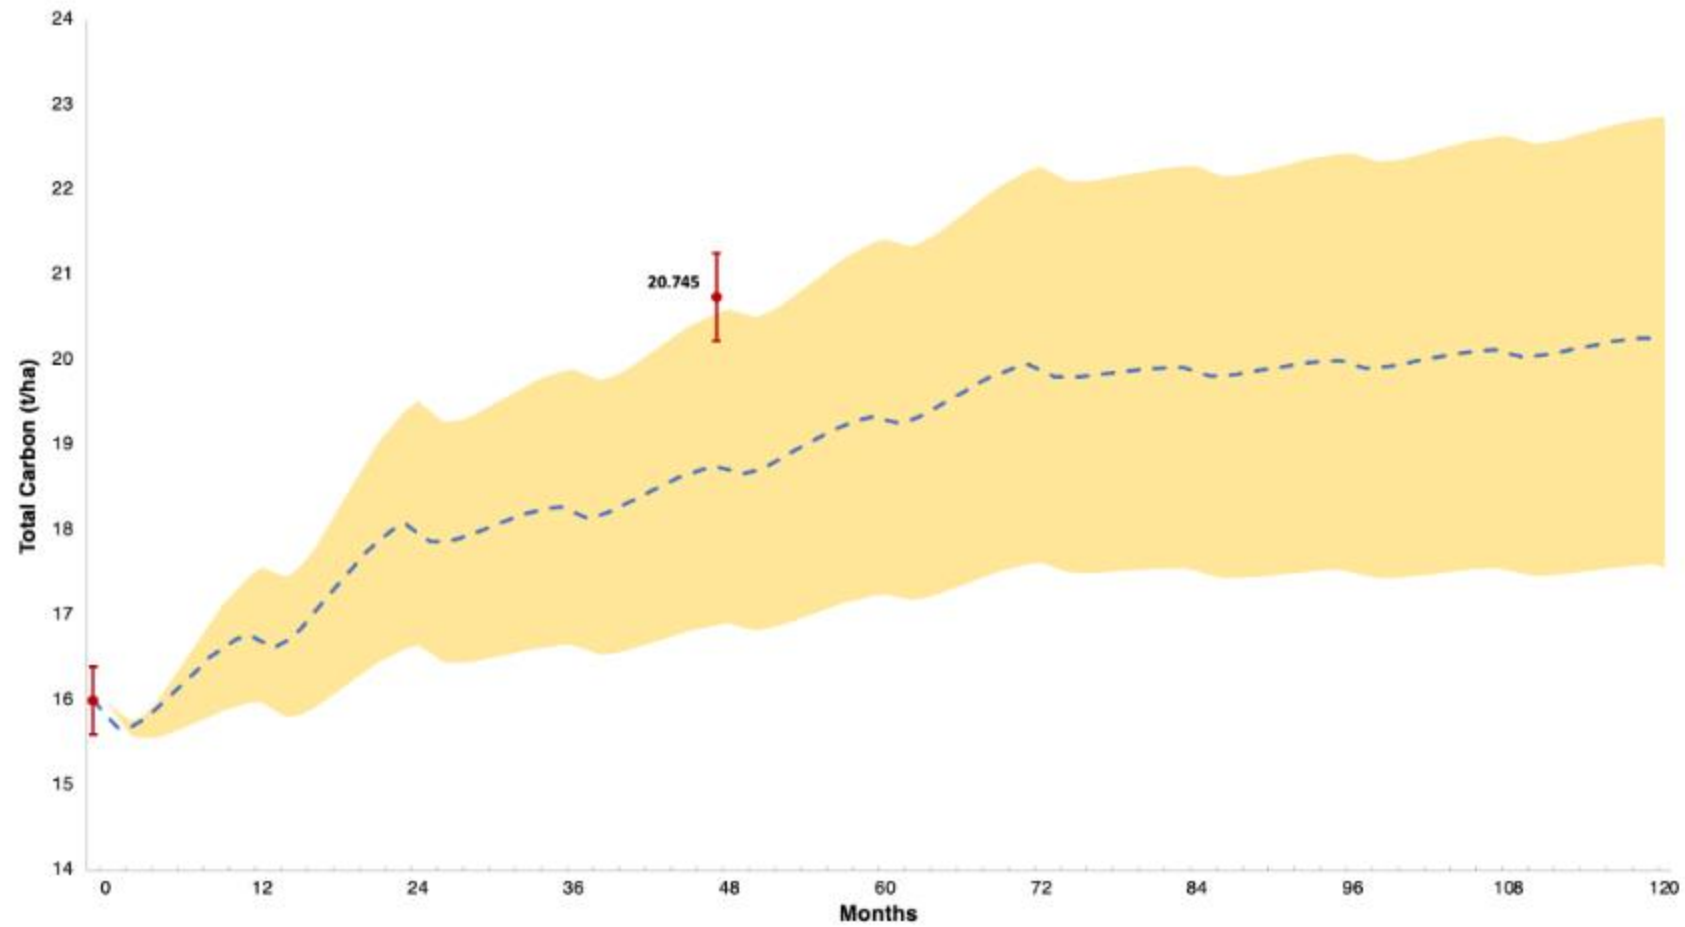

Acknowledgement: Joint MSc of Utrecht University, National and Kapodistrian University of Athens, and ICARDA.

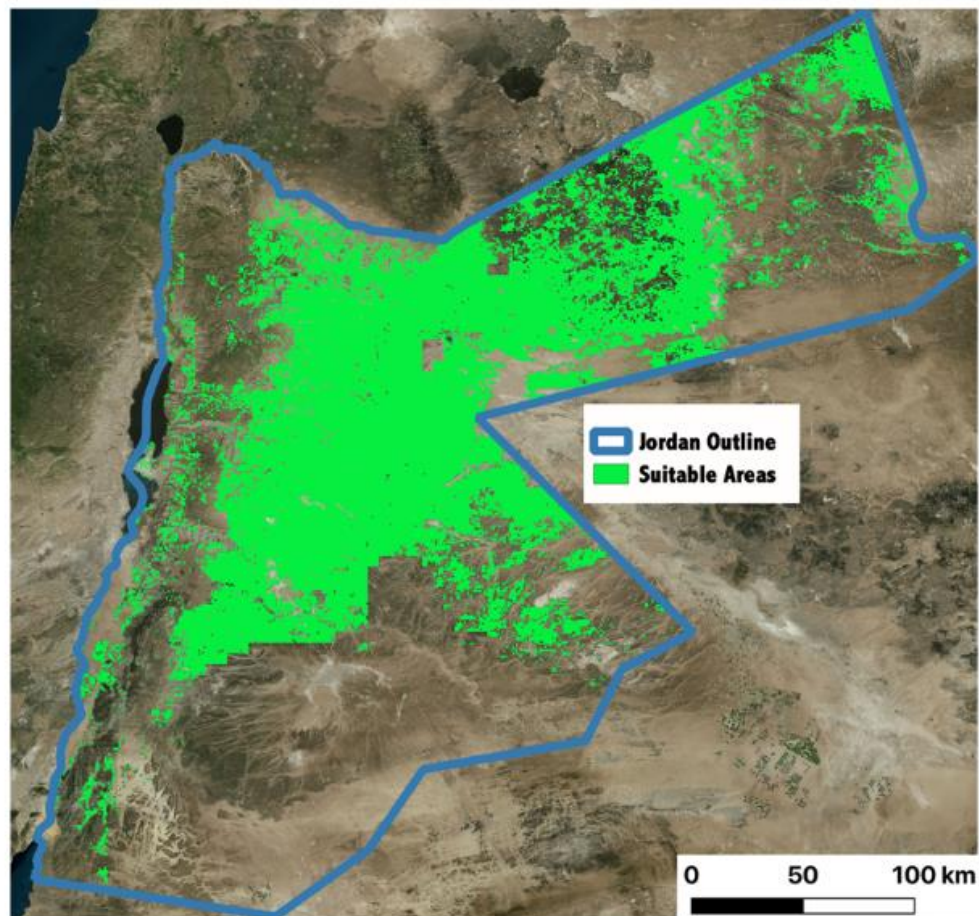

Modeling using RothC

Scenario	1	2	3	4
Carbon Price (\$/ton)	30	55	80	120
Total Suitable Area (ha)	4,574,000			
Implementation Cost (\$/ha)	95			
Total Carbon Sequestered (tons)	2,973,100			
Total Costs (\$)	434,530,000			
Total Benefits (\$)	89,193,000	163,520,500	237,848,000	356,772,000
Cost-Benefit Result (\$)	345,337,000	271,009,500	196,682,000	77,758,000
Offset Cost (\$/ha)	75.50	59.25	43.00	17.00

Benefits of marginal dryland rehabilitation beyond biomass

The ecosystem services approach

Design soil-water-ecosystem processes experiments and monitoring campaign

Testing and out-scaling in situ water harvesting approaches in Palestine

... enhanced capacities on water-food-ecosystem services nexus implications of in situ water harvesting based orchard agriculture will eventually increase local stakeholders' preparedness for uptake and out-scaling...

Water

Food

Ecosystem services

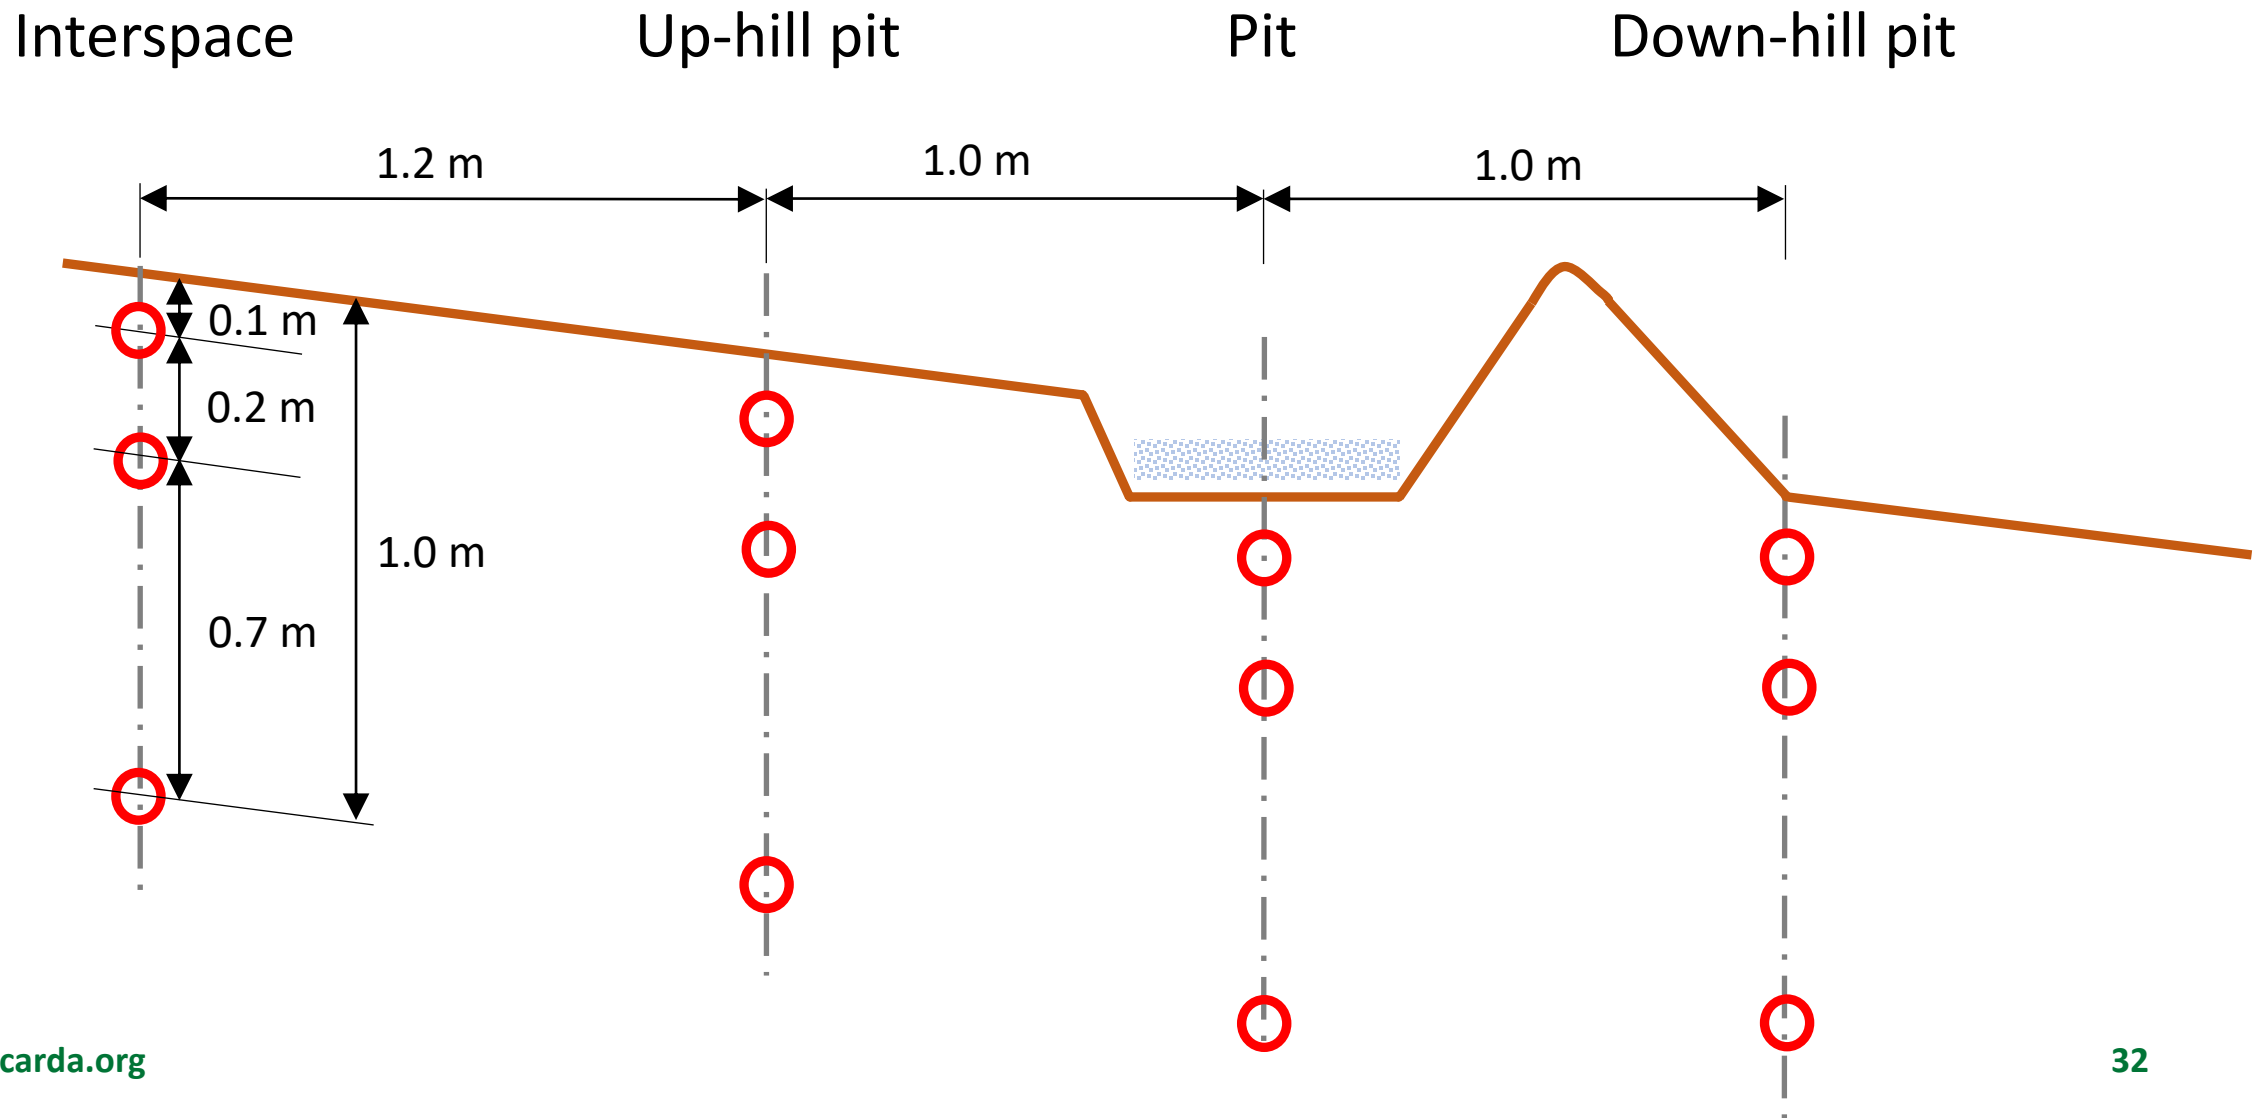

Monitoring

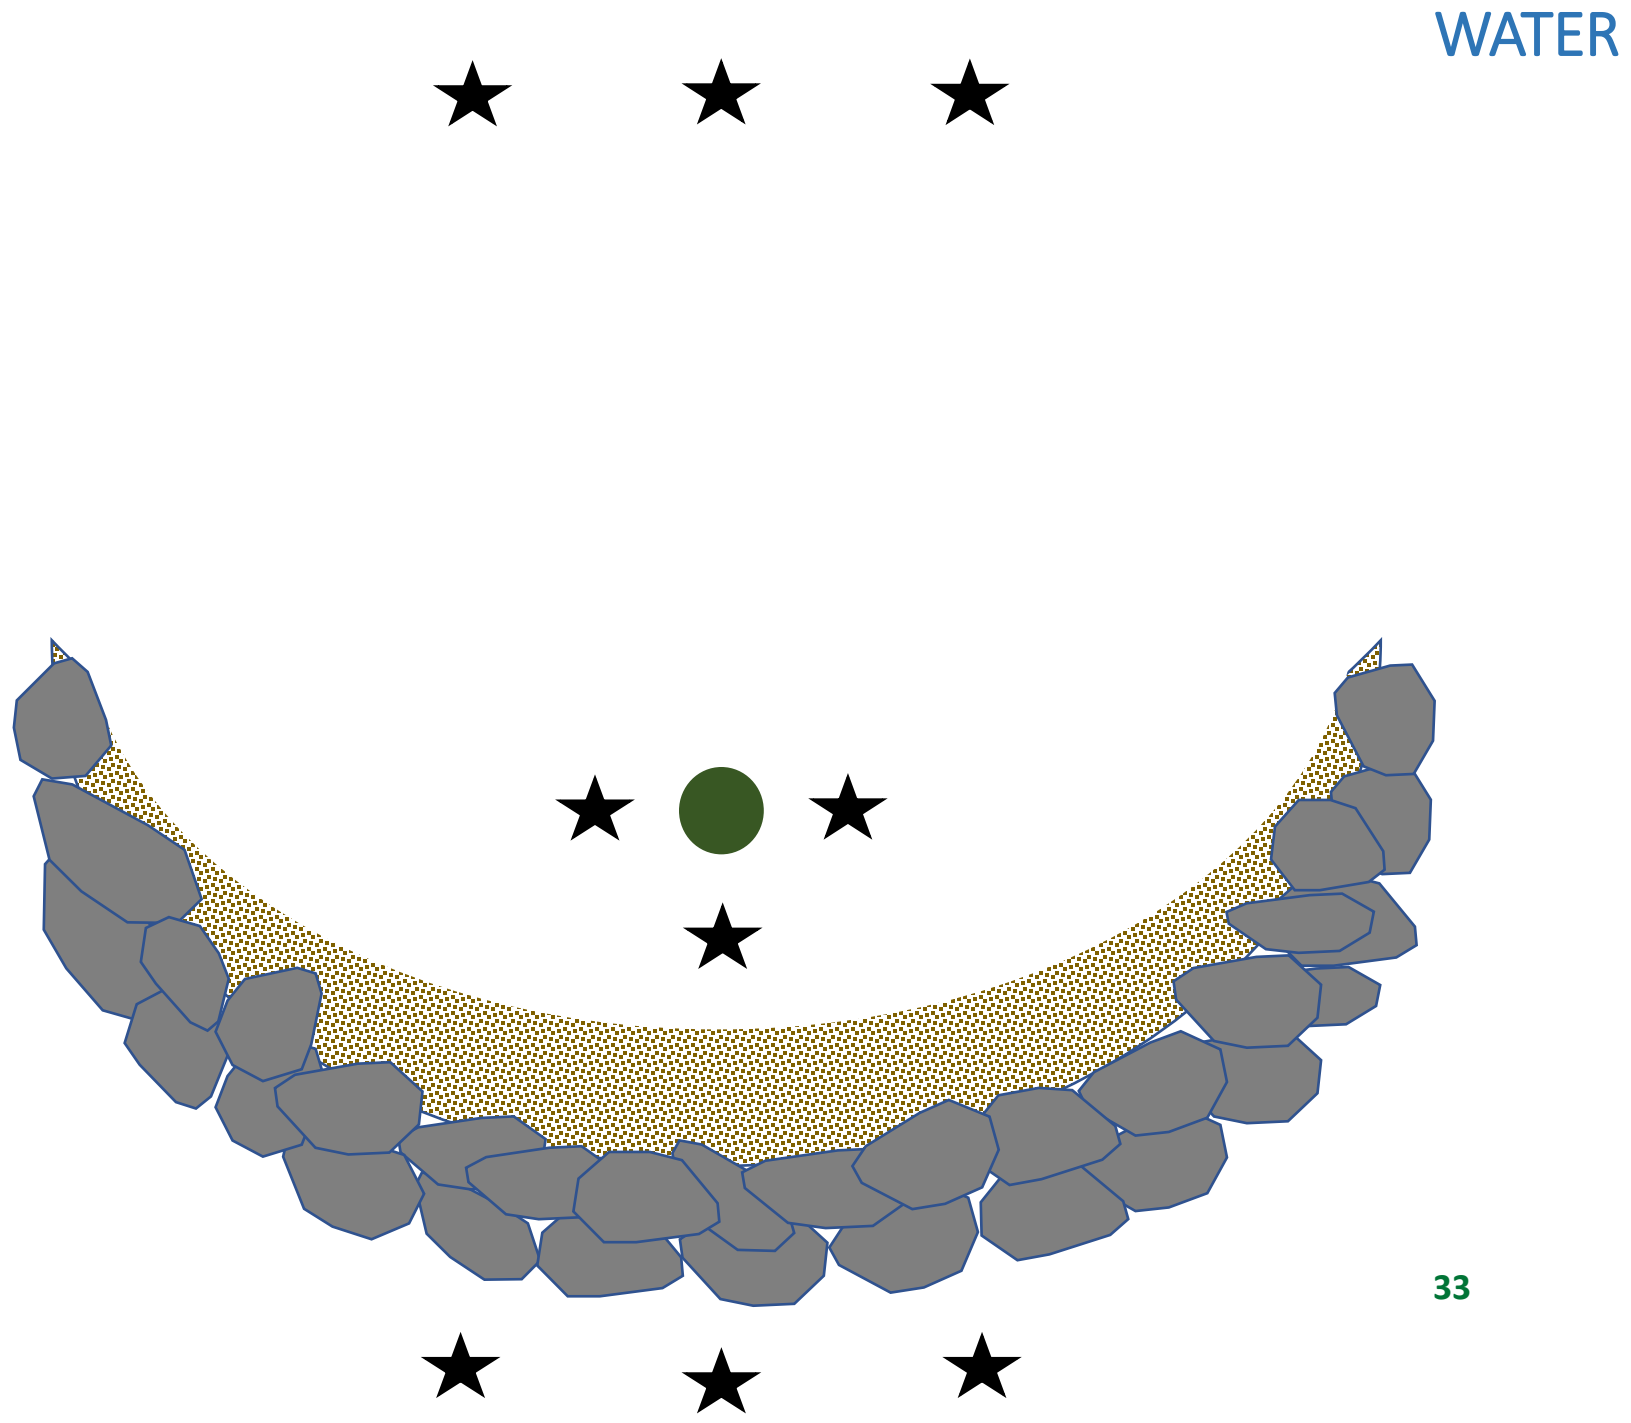

- Rainfall
- Runoff?
- Soil moisture

Modeling

- Surface runoff
- Soil water (states/stress)

Monitoring

- Olive yield
- Other species/herbs?
- Silvo-pastoral grazing considerations?

-> farmers questionnaires?

PLANT | SOIL | WATER

Monitoring

- Plant
- Soil

PLANT | SOIL | WATER

Monitoring

- Target plant biomass -> food
- Target plant status monitoring (survival rate, height, stem diameter)
- Biodiversity
- Vegetation cover (space & time)

Monitoring

- Surface marks (e.g. erosion rills)
- Surface crust analysis
- Disturbed soil samples (aggregates, texture, carbon, nutrients, ...)
- Undisturbed (surface) samples (bulk density, pore space, water holding capacity (lab), hydraulic conductivity, ...)
-

Surface rill analysis

Soil Health Assessment

Soil health, or soil quality, describes the continued capacity of a soil to function as a vital living ecosystem that sustains plants, animals, and humans. Main services of a well-functioning soil are (Seybold et al., 1998):

1. Sustaining biological activity, diversity, and productivity
2. Regulating and partitioning water and solute flow
3. Filtering and buffering, degrading, immobilizing, and detoxifying organic and inorganic materials, including industrial and municipal by-products and atmospheric deposition
4. Storing and cycling nutrients and other elements within the earth's biosphere
5. Providing support of socioeconomic structures and protection for archeological treasures associated with human habitation

Quantitative soil health indicator list (adapted from: USDA NRCS, 2001)

Ranking: (1) highly feasible / highly recommended; (5) not feasible / not recommended (for discussion).

INDICATOR	CONTEXT	FEASIBILITY	RECOMM.
PHYSICAL			
Soil structure	Retention and transport of water and nutrients, habitat for microbes, and soil erosion	3	1
Depth of soil and rooting	Estimate of crop productivity potential, compaction, and plow pan	3	2
Infiltration and bulk density	Water movement, porosity, and workability	2	1
Water holding capacity	Water storage and availability	2	2
CHEMICAL			
pH	Biological and nutrient availability	2	1
Electrical conductivity	Plant growth, microbial activity, and salt tolerance	1	1
Extractable nitrogen (N), phosphorus (P), and potassium (K)	Plant available nutrients and potential for N and P loss	4	3
BIOLOGICAL			
Soil organic matter (SOM)	Soil fertility, structure, stability, nutrient retention, soil erosion, and available water capacity	4	2
Microbial biomass carbon (C) and N	Microbial catalytic potential and repository for C and N	4	4
Potentially mineralizable N	Soil productivity and N supplying potential	4	5
Soil respiration	Microbial activity measure	5	5

.... Lets brainstorm and draft
